BEDIA

The company

Measuring with system and passion

As a high performance and innovative company BEDIA develops, produces and distributes well thought out solutions for level and temperature monitoring.

We have been concentrating our skills in the domain of measuring filling levels and temperatures under extreme operating conditions. We are able to offer customized solutions to the specific requirements of our clients for small to large series. In doing so we are combining tried and tested technologies with innovative product ideas. Our expertise and flexibility are well demonstrated in the development of customer specific solutions.

One thing that all our products have in common is the nonexistence of moving or adjustable parts; our parts are not subject to mechanical interference and exhibit exceptional operational reliability.

Since 1986 BEDIA Motorentechnik is a valued partner of numerous manufacturers of agricultural and construction machinery, compressors, engines, power train control systems and utility vehicles.

The high quality requirements of our world wide operating customers are our motivation for the constant improvement of our products and processes. The stable customer relationships of many years standing express the high quality of our products and the satisfaction of our customers.

We hope you will get a comprehensive overview of our products from this catalog. Please feel free to contact us, we will be happy to assist you with our advice and experience.

Company history at a glance

2025	currently about 150 employees
2016	30th company anniversary
2012	Foundation of BEDIA Sensors USA in Austin, Texas
2009	Relocation of BEDIA Motorentechnik and BEDIA Kabel to the new corporate building in Altdorf in the industrial park close to the highway A6.
2008	Takeover of the production for sensors from the business entit E-T-A in Altdorf
2006	Spin-off of the new BEDIA Kabel business unit from BEDIA Motorentechnik GmbH & Co. KG into BEDIA Kabel GmbH & Co. KG.
2005	Reorganization of BEDIA Motorentechnik GmbH into BEDIA Motorentechnik GmbH & Co. KG, preparation and the transfer of business administration to Holger Schultheis.
2000	Sale of the water treatment business unit to Aqua-Concept GmbH.
1994	Transfer of the Sensor Systems and Water Treatment business unit from BEDIA Maschinenfabrik to BEDIA Motorentechnik.
1986	Foundation of BEDIA Motorentechnik in Leinburg. Core focus business with vehicle wiring cables and delivery of sensor parts for the Bedia Maschinenfabrik in Bonn.

Our products at a glance

- capacitive level sensors for a versatile range of applications:
 - CLS 20/25 for railway applications tested according to DIN EN 50155
 - CLS 40/45 for off- and onroad applications with E1-type approval of the KBA
 - CLS 50/55 for maritime applications with approvals of the classification societies
- intelligent, analog tank sensors for fuels and oils
- intelligent, level monitoring for engine and hydraulic oils as well as diesel fuels with an integrated temperature measurement
- temperature sensors
- mechanical temperature switches
- electronic temperature switches
- electronic temperature sensors
- DC/DC converters

**We are certified in accordance with
ISO 9001:2015 and ISO 14001:2015.**

GENERAL DESCRIPTION

Areas of application and advantages

BEDIA level monitoring sensors are used to monitor the filling levels of liquids. The sensors detect when a filling level is exceeded or falls below a limit.

Water-based liquids like coolants, AdBlue®, fresh water, waste water and oil-based liquids like motor oils, hydraulic oils, fuels and brake fluids can be monitored. Due to their rugged design, high IP protection classes and a working temperature range from -40°C to 125°C (-40°F to +257°F) the BEDIA monitoring sensors are primarily used in the following areas:

- RAILWAY
- ENGINES
- HYDRAULIC POWER-TRAIN CONTROL SYSTEMS

Wherever pressure switches or temperature sensors are today used as level monitoring elements, this sensor offers the advantage of indicating a critical condition far earlier:

Temperature sensors frequently react too late, because the medium to be monitored is no longer present. The rise in temperature is not passed on to the pick-up sensor. Pressure switches do not indicate low oil until there is a total shortage of oil and thus too late to protect the engine. The level sensor already indicates a critical filling level.

■ Sensor for water-based liquids

■ Sensor for oil-based liquids

BEDIA Level Monitoring Sensors differ from float-type switches in their compact design and their resistance to vibration:

Since they contain no mechanical moving parts, their function will not be influenced by dirt particles or other influences. No electrical current is sent through the medium via an electrode with BEDIA sensors, an electrolysis of the medium is not possible.

MEASURABLE MEDIUMS

Operating principle

The function of the sensor is based on the capacitive principle. It detects the change in capacitance that occurs when an electrode surrounded by air is immersed into a liquid medium. This change in capacitance at the electrode of the sensor excites an oscillator. This signal is processed by a microcontroller-based evaluation circuit which activates or deactivates an output stage.

Capacitance measurement

Types of media

The level monitoring sensors are designed for two different media types:

- **For electrically conductive liquid media**
with relative permittivity within a range of ϵ_r 35 ... 85
(water, coolant, water/glycol mixture)
- **For electrically non-conductive liquid media**
with relative permittivity within a range of ϵ_r 1.8 ... 6
(engine oil, fuels, hydraulic oil)

SWITCHING OUTPUTS

Output variants available

			Low Voltage (LV) $U_B = 4,5 - 18 \text{ V}$ Type CLS-25	High Voltage (HV) $U_B = 9 - 36 \text{ V}$ Type CLS-20
positive switching (HSS)		The output transistor switches positive potential at the output	—	✓ 1 A short circuit and overload proof
negative switching (LSS)		The output transistor switches negative potential at the output	✓ 0.5 A short circuit and overload proof	✓ 1 A short circuit and overload proof
analog output (AOV)		0.5 V* or 4.5 V* output voltage *other values on request	✓	✓
proportional analog output 30 % / 70 % (AOP)		30 %* or 70 %* respectively of the supply voltage as output voltage *other values on request	✓	—

Function control time

After the supply voltage is applied (e.g. ignition being switched on), the output is activated for the function control time, thus signalling operational readiness. If this signal does not appear, the sensor should be checked. The default function control time is 2 seconds. This self-monitoring makes it possible to check the level monitoring sensors from a central point for their operational readiness as well as for cable breaks. Especially in intricate, ramified systems, such as ships, checking conventional level switches may be very difficult.

Other function control times are available upon request.

Fault indication delay time

To avoid indication errors when the swashing surface produces short fluctuations of the liquid level, the output signal is delayed with the standard fault indication delay time of seven seconds.

Other indication delay times are available upon request.

INSTALLATION INSTRUCTION

Mounting position

BEDIA level monitoring sensors may be installed in any position.

For properly function the level sensors should be mounted in a calm area of the tank, otherwise a sensor with a fault indication delay should be used.

This point is usually applicable for installation in gearboxes or for direct installation in engine oil pans during operation. In such cases, the measurement is only possible at engine shutdown.

It is mandatory to mount the sensor with a minimum distance of 7 mm to the wall.

Mounting position for water-sensors

If the sensor is installed from above in a non-conductive, e.g plastic container, erroneous messages might occur due to a missing reference potential.

In all other mounting positions, the housing will come in contact with the medium. This ensures that a reference potential will be present.

FUNCTIONALITY OVERVIEW

Minimum-Sensors

If a minimum sensor is removed from the medium, the output is activated after the fault indication delay time. For a working current sensor, the output goes low-impedance (active) and the output signal is available. For a quiescent current sensor, the output goes high-impedance (inactive) and the output signal is no longer available.

If a minimum sensor is immersed in the medium, the output is deactivated instantaneously. For a working current sensor, the output goes high-impedance (deactivated) and the output signal is no longer available. For a quiescent current sensor, the output goes low-impedance (active) and the output signal is available.

It is possible to select a fault indication delay time of 0 seconds for instantaneous switching.

FUNCTIONALITY OVERVIEW

Maximum-Sensors

If a maximum sensor is immersed in the medium, the output is activated after the fault indication delay time. For a working current sensor, the output goes low-impedance (active) and the output signal is available. For a quiescent current sensor, the output goes high-impedance (inactive) and the output signal is no longer available.

If a maximum sensor is removed from the medium, the output is deactivated instantaneously. For a working current sensor, the output goes high-impedance (deactivated) and the output signal is no longer available. For a quiescent current sensor, the output goes low-impedance (active) and the output signal is available.

It is possible to select a fault indication delay time of 0 seconds for instantaneous switching.

OVERVIEW OF THE CONNECTIONS

Level sensors Type CLS 20/25

- Connector bayonet ISO 15170
Protection class IP 69K ISO 20653

ACCESSORIES

for level monitoring sensors in the oil sump

Proposal for level monitoring in the oil sump

Which are the benefits of a level monitoring system in the oil sump over conventional pressure and temperature sensors?

Temperature sensors react very slowly. When engine oil is lost, e. g. by tubing breakage, the engine temperature is no longer conducted to the sensor.

The lower limit value of oil pressure switches or sensors is set low (low oil pressure, with the motor running at no load). At rated motor speed and with too little oil in the oil circuit an oil-air mixture may be formed and no alarm signal is given. The engine is no longer sufficiently cooled and lubricated.

In the two events described above, the alarm signal is available either too late or even not at all so that the engine will be damaged. The level monitoring sensor gives the alarm before a serious oil deficiency occurs. The oil deficiency is indicated as soon as the oil level has fallen 10 to 20 mm below the minimum marking on the dipstick.

Special accessoires for level sensors type CLS 20 and type CLS 25

Order No.	Description	Length	Picture-Nr. (see illustration)
421 660	Tubing complete with 350 mm pipe coupling	350 mm	1
421 661	Tubing complete with 450 mm pipe coupling	450 mm	1
421 659	Tubing complete with 550 mm pipe coupling	550 mm	1
454 134	Sensor support		2
421 662	PA pipe, available in meters		3
	Level monitoring sensor	OIL MIN 9–36 V	4
	Level monitoring sensor	OIL MAX 9–36 V	4
420 703	Connector ISO 15170	straight	5
420 702	Connector ISO 15170	90° angle	5
420 707	Connector ISO 15170	with cable 1000 mm straight	5
420 706	Connector ISO 15170	with cable 1000 mm 90° angle	5

Installation instructions

1. Drain the engine oil.
2. Fasten adjustable corner swivelling screw-fitting to the engine with hose line and sensor bracket.
The sensor holder has to be adjustable by the slots to determine the minimum point.
3. Install the ventilation to the crankcase (such as inspection hole cover)
4. Install and connect the sensor.
5. Check for correct electrical function. The minimum sensor must indicate now.
6. Refill the oil up to the minimum marking on the dip stick.
7. Move the sensor and support slowly down until the signal is no longer available.
The switch point of the sensor is now exactly at the minimum oil level of the motor.
8. Move the sensor down by another 10 to 20 mm and fix it. The signal „oil level too low“ will now be put out when the level is approx. 10 to 20 mm below the minimum marking on the dipstick.

TECHNICAL DATA

For level monitoring sensors CLS 20

Medium	Water / Oil
Function	Minimum - Maximum
Operating voltage	12 V (-25% / +50%) 24 V (-30% / +50%) (9 - 36 V DC)
Current consumption	< 8 mA
Output low-side switch / high-side switch	≤ 1 A over the whole temperature range. Short-circuit and overload protected over the ambient temperature range. For inductive loads freewheeling diode e.g. 1N4007, has to be mounted at load.
Output analog switching	output load > 10 kOhm
Mounting thread	see order number overview
Function control time	see order number overview
Fault indication delay time	see order number overview
Connection	see order number overview
Housing material	CuZn38Pb2 EN12164; CW608N housing capacitive connected to ground
Sheath of sensing device	Tefzel ® ETFE
Sensor protection	IP 65 - 69K nach ISO 20653 (depending on connector type)
Switch point hysteresis	typic < 3 mm
Medium temperature	-40°C to +125°C (-40°F to +257°F) water +150°C (oil)
Ambient temperature	-40°C to +125°C (-40°F to +257°F)
Storage temperature	-50°C to +125°C (-58°F to +257°F)
Mounting position	any
Reverse polarity protection	inbuilt, between positive and negative terminal

Caution!

With low-side switching sensors do not connect **minus potential** to the signal terminal and plus potential to the minus terminal. With high-side switching sensors do not connect **plus potential** to the signal terminal and minus potential to the plus terminal.
