

**SINGLE TURN
ABSOLUTE
ENCODER
390CBB**

Absolute single turn encoder, from 2 to 13 bits, in extremely sturdy housing for heavy duties. Supplied with insulated hollow shaft passing through and insulated inside spring coupling.

ELECTRONIC OUTPUT	INTERFACE	PARALLEL OPTIONS
» (-) NPN open coll.10mA(std) 	» (-) Parallel (standard) The angular value is present on the output connector in a 'parallel' form. The number of conductors is proportional to the resolution and the type of selected code. Any electronic output stage can be applied.	» (F)Led zero Designed for setting the encoder position with mechanical position. Led lights up at zero value with clockwise increasing code, at max. value with contrary clockwise.
» (KK) NPN open coll.70mA + PTC 	» (S) Serial SSI The data output (available only with Gray or Excess code) is controlled by an external clock. The angular position's value is first stored into the encoder and then transmitted outside starting from the MSB. The standard of transmission is RS422.	» (L)Latch When Latch input is set to 0 Vdc the outputs at Gray code disc level are 'frozen'; in such a way detections are carried out in stable conditions. For this reason Latch input is standard for Binary and BCD codes.
» (KP) NPN open emitt.70mA+ PTC 		» (P)Parity An electronic circuit generates a signal (Parity) in such a way that the number of high level outputs is always odd; then there isn't any condition with all low level outputs. This option allows to carry out automatic checkout of the output stages.
» (B) Push-p. 70mA+PTC 1÷12bit 		» (M)Multiplexer The outputs must be enabled by an external 'enable' signal; this method provides the connection in parallel of several encoders on a single bus. The number of conductors is proportional to the resolution and to the type of selected code.
