

CSB400 Series Commercial / Industrial Pressure Reducing Regulators

Figure 1. Typical CSB400 Series Pressure Reducing Regulator

Features and Benefits

- **Integral True-Monitor™**—Regulator and Monitor in One Unit
- **Slam-shut**
- **Ductile Cast Iron and WCC Steel Bodies Available**
- **Wide Variety of Body Sizes and End Connections**
- **No Special Tools for Pressure Adjustment and Orifice Removal**

Introduction

The CSB400 Series direct-operated, spring-loaded regulators have been engineered to fit a multitude of pressure-reducing applications including commercial and industrial installations. This flexibility is provided by the numerous body sizes and end connections, outlet pressure settings, as well as the option for internal, external or dual pressure registration. In addition to application flexibility, the CSB400 Series offers multiple overpressure protection options to meet your demands on application requirements.

Figure 2. Type CSB404 Regulator with Type VSX4 Slam-shut Internal View

Multiple Overpressure Protection Options Available:

- **Token Internal Relief** - Provides relief from minor overpressure caused by nicks or dents on the orifice or by thermal expansion of gas in the downstream line. Token relief also provides a token or signal, in the form of odor, that an overpressure situation is occurring.
- **True-Monitor™ Protection** - Combines the operation of a conventional two-regulator wide-open monitor set into one body.
- **Slam-Shut Protection** - Discontinues gas service by shutting off the gas flow if there is an overpressure or underpressure condition.

Specifications

The Specifications section lists the specifications for the CSB400 Series Regulators. The following information is stamped on the nameplate of CSB400 Series: Type and Class, Maximum Outlet Pressure and Spring Range.

Available Configurations

See Table 1

Body Sizes, Materials, End Connections and Pressure Ratings⁽¹⁾

See Table 2

Inlet Pressure Ratings⁽¹⁾

See Table 3

Maximum Outlet Pressures⁽¹⁾

Emergency Casing: 4.0 bar / 58 psig

To Avoid Internal Parts Damage:

All other Types: 0.34 bar / 5.0 psig above outlet pressure setting

Type CSB450: 1 bar / 14.5 psig above outlet pressure setting

Operating: 3.0 bar / 43.5 psig

Outlet Pressure Ranges⁽¹⁾

17 mbar to 3.0 bar / 6.8 in. w.c. to 43.5 psig

See Table 5

Flow Capacities

See Tables 9 through 28

Orifice Size

Construction Materials

CSB400 Series Main Valve and Actuator

Body: Ductile Cast Iron and WCC Steel

Body O-ring: Nitrile (NBR)

Closing Cap and Adjusting Screw: Aluminum

Diaphragm Case, Spring Case, Diaphragm Plate and Valve Stem: Aluminum

Orifice: Aluminum

Pusher Post: Zinc-plated Steel

Relief Valve Seat: Aluminum

Diaphragm and Disk: Nitrile (NBR)

Control Spring: 302 Stainless steel

Relief Valve Spring: 302 Stainless Steel

Relief Valve Diaphragm Retainer: Steel

Vent Screen: 18-8 Stainless steel

Retainer Ring: Steel

Lever Pin: Stainless Steel

Spring Seat, Lever and Other Metal Parts: Steel

TM600 Series True-Monitor Actuator

Diaphragm Case, Spring Case, Diaphragm Plate and Valve Stem: Aluminum

Diaphragm and Disk: Nitrile (NBR)

Control Spring: 302 Stainless steel

Vent Screen: 18-8 Stainless steel

Vent Screen Retainer: Stainless steel

Closing Cap: Aluminum

Adjusting Screw: Aluminum

Type VSX4 Slam-shut Device

Diaphragm Case, Spring Case, Diaphragm Plate and Valve Stem: Aluminum

Diaphragm and Disk: Nitrile (NBR)

Control Spring: Music Wire or 302 Stainless steel

Vent Screen: 18-8 Stainless steel

Vent Screen Retainer: Zinc-plated steel

Closing Cap: Aluminum

Adjusting Screw: Aluminum

Approximate Weights

with Threaded body

Type CSB400: 4 kg / 9 lbs

Type CSB403: 9 kg / 20 lbs

Type CSB404: 5 kg / 11 lbs

with Flanged body

Add 4 kg / 9 lbs to weights listed

Designed, Tested and Evaluated Consistent With:

ANSI B16, ASME Section 8, ASTM B117

(Corrosion Resistance) and EN 334

1. The pressure/temperature limits in this Bulletin or any applicable standard limitation should not be exceeded.

2. Standard token relief set values listed in Table 8 are based on -20 to 60°C / -4 to 140°F.

3. Product has passed Fisher® testing for lockup, relief start-to-discharge and reseal down to -40°.

Principle of Operations

Refer to Figures 4 and 5. When downstream demand decreases, the pressure under the diaphragm increases. This pressure overcomes the regulator setting (which is set by a spring). Through the action of the pusher post assembly, lever and valve stem, the balanced port assembly moves closer to the orifice and reduces gas flow. If demand downstream increases, pressure under the diaphragm decreases. Spring force pushes the pusher post assembly downward and the balanced port assembly moves away from the orifice.

Installation

The CSB400 Series regulators may be installed in any position. However, the spring case vent should be pointed downward. If gas escaping through the CSB400 Series token internal relief valve could constitute a hazard, the spring case vent must be piped to a location where escaping gas will not be hazardous. If the vented gas will be piped to another location, obstruction-free tubing or piping at least equal to the vent and the end of the vent pipe must be protected from anything that might clog it.

Figure 3. CSB400 Series with External Registration and Token Relief Operational Schematic

Figure 4. CSB400 Series with Internal Registration and Token Relief Operational Schematic

Pressure Registration and Downstream Control Line Connection

Internal Registration

CSB400 Series regulators with an “IT” or “IN” in the type number have internal pressure registration. Internal registration utilizes an internal sense tube located in the outlet of the body to communicate the outlet pressure to the actuator chamber. Internal registration is used for ease of installation. Response time of the regulator is not as quick as dual registration due to internal sense only having one sensing port feeding the actuator chamber.

Dual Registration

CSB400 Series regulators with an “DT” or “DN” in the type number have dual pressure registration. Dual registration utilizes both internal sense and an external downstream pressure registration line (control line) connected to the 3/4 NPT control line tapping in the lower diaphragm casing. By providing two channels of pressure communication to the actuator, dual registration provides the best method of pressure registration for applications that exhibit quick changing loads. Refer to the CSB400 Series Instruction Manual for instruction regarding downstream control line installation. The Type VSX4 slam-shut and Integral Monitor have external pressure registration only and require downstream control line installation. One exception exists when the Primary regulator is installed on a Rp 1 x 2-1/4 GAZ body, then the Type VSX4 slam-shut has the option of internal pressure registration.

External Registration

CSB400 Series regulators with an “ET” or “EN” in the type number have external pressure registration. External registration does not sense pressure internally, but utilizes a 3/4 NPT control line tapping in the lower diaphragm casing. A regulator with a downstream control line is typically used for monitoring installations or other applications where there is an equipment installed between the regulator and the pressure control point. The balance port separates the body pressure from diaphragm case pressure on monitor installations where leakage cannot be tolerated. Refer to the CSB400 Series Instruction Manual for instruction regarding downstream control line installation. The Type VSX4 slam-shut and Integral Monitor have external pressure registration only and require downstream control line installation. One exception exists when the Primary regulator is installed on a Rp 1 x 2-1/4 GAZ body, then the Type VSX4 slam-shut has the option of internal pressure registration.

Internal Token Relief

CSB400 Series regulators with a “T” in the type number, provide a low capacity or token internal relief to help minimize overpressure. The token relief also acts to avoid nuisance trips of the slam-shut mechanism due to pressure increase from thermal expansion or overpressure caused by orifice damage such as nicks and dents.

Overpressure Protection

Overpressuring any portion of a regulator or associated equipment may cause personal injury, leakage or property damage due to bursting of pressure-containing parts or explosion of accumulated gas. Provide appropriate pressure relieving to ensure that the critical limits in the Specification section are not exceeded. Regulator operation within ratings does not prevent the possibility of damage from external sources or from debris in the pipeline.

The CSB400 Series regulators have outlet pressure ratings that are lower than their inlet pressure ratings. A pressure relieving or pressure limiting device is needed for the CSB400 Series that do not have an Integral Monitor or slam-shut device installed or do not have a separate upstream monitoring regulator installed such as the Type CSB410.

Types CSB403 and CSB423 provide an integral True-Monitor™ installed on the inlet side of the body that serves to control downstream pressure if the primary regulator ceases to control downstream pressure.

Types CSB404, CSB424 and CSB454 regulators rely on Type VSX4 slam-shut device for overpressure protection. In the event that outlet pressure rises above or falls below the pressure setting of the Type VSX4, the slam-shut device will activate or trip, thereby stopping flow through to the downstream system. To restart flow to the downstream system, the Type VSX4 must be reset. Type CSB404 regulators with a “T” in their type number provide a low capacity (Token) internal relief which provides sufficient relief to preclude the Type VSX4 tripping due to pressure rise caused by thermal expansion or overpressure due to orifice damage such as nicks and dents.

Types CSB410 and CSB430 are monitor regulators installed upstream of the Primary regulator. An external control line is connected downstream of the Primary regulator to provide protection if the Primary regulator would cease to control downstream pressure.

Types CSB414 and CSB434 regulators act in the same manner as the Types CSB410 and CSB430 described previously, however, they also provide additional overpressure protection to the

Damage or disconnected lever	X	---
Damage to diaphragm	X	---
Blocked or broken registration to primary regulator	X	---

1. As the Integral Monitor is externally registered, it is required that the Primary and Integral Wide-Open Monitor do not share downstream sense lines.

downstream system via a slam-shut that activates if the downstream system pressure rises above or falls below the setpoint of the slam-shut.

Upstream Monitoring Regulator

Types CSB410, CSB414, CSB430 and CSB434 act as separate upstream monitoring regulators. These upstream monitor regulators in the same manner as a Type CSB400 with external pressure registration only, they are installed upstream of a primary regulator. If the downstream Primary regulator ceases to control the downstream system pressure and downstream pressure begins to increase, this pressure increase is registered underneath the diaphragm of the Upstream Monitor regulator through the downstream control line. The increased pressure will overcome the force for the control spring and cause the diaphragm assembly to move upward, thereby moving the lever upward and moving the disk closer to the orifice to regulate flow and downstream system pressure.

Integral True-Monitor™ Protection

Types CSB403 and CSB423 combine the operation of a conventional two-regulator wide-open monitor set into one body. The Integral True-Monitor installed on the inlet side of the body and serves to throttle flow and maintain an acceptable downstream pressure in the case where the Primary regulator ceases to control the downstream pressure. Unlike multiple seat designs that rely on the primary regulator for all failure modes, the Type CSB403 provides protection from a wide variety of occurrences that could cause the Primary regulator not to regulate downstream pressure. Table 6 shows a comparison between the Integral True-Monitor protection and the protection offered by an orifice backup device.

Refer to Figure 5. If the Primary regulator ceases to control downstream pressure, outlet pressure will rise underneath the diaphragm of the Integral monitor, which will assume control of the downstream pressure.

Table 6 shows a comparison between the Integral True-Monitor protection and the protection offered by

Figure 6. Type CSB404ET Externally Registered Regulator and Slam-Shut Operational Schematic

a backup orifice device, which seals on a secondary seating surface should the primary orifice seating surface or disk become damaged.

The Integral True-Monitor™ is externally registered and will require a downstream control line. If the primary regulator has internal registration, the monitor will still require an external control line for pressure registration.

Token Relief

An optional token relief may be installed on the primary regulator of the Type CSB403, denoted by the “T” in the type number, for example, Type CSB403ET. The token relief will be activated when the pressure rises and activates the monitoring regulator in order to provide an indication that the monitor is controlling flow instead of the primary regulator.

Type VSX4 Slam-Shut Device

The Type VSX4 slam-shut device on the Type CSB404 regulator is a fast acting shutoff device that provides overpressure (OPSO) or over and underpressure (OPSO/UPSO) protection by shutting off the flow of gas to the downstream system. The Type VSX4’s actions are independent of the Type CSB404 regulator and of variations to the inlet pressure. The Type VSX4 uses external pressure registration and requires a downstream control line regardless if the regulator is internally or externally registered.

Refer to the CSB400 Series Instruction Manual for instruction regarding downstream control line installation. The Type VSX4 slam-shut has an external pressure registration only and requires downstream control line installation. One exception exists when the Primary regulator is installed on a Rp 1 x 2-1/4 GAZ body, then the Type VSX4 slam-shut has the option of internal pressure registration.

Refer to Figures 6 and 7, shutoff disk is normally located in the open (reset) position. If the pressure below the diaphragm increases (or decreases) reaching the Type VSX4 setpoint, the diaphragm will travel upwards (or downwards) to release the trip mechanism which allows the spring force on the stem will push the stem and disk against the seat, shutting off all gas flow. The manual reset has an internal bypass to equalize the reset pressure on either side on the shutoff disk.

In order for the Underpressure Shutoff (UPSO) of any slam-shut to be triggered, the downstream pipe pressure must drop below the UPSO setpoint. In the case of a downstream line break, numerous factors can prevent the downstream pipe pressure from decreasing below the slam-shut UPSO setpoint. These factors include the distance of pipe to the break, the diameter of the pipe, size of the break and the number of restrictions, such as valves, elbows and bends, downstream of the regulator and/or slam-shut device. Due to these factors additional protections should be installed to stop flow in the event of a line break.

1. Standard factory set shown. Factory set is at the Minimum value of the range indicated. Range indicated is a percentage of Setpoint. Percentage indicated is based on the Set Pressure Range in which that setpoint resides. If non-standard sets are required, adherence must be made to constraints shown in Table 7, including Token Relief Set Range, OPSO and UPSO set range and Minimum Required difference between Token Relief and OPSO Set.

2. Minimum Token Relief values apply to -20 to 60°C / -4 to 140°F service temperatures. For service below -20°C / -4°F, add 8 mbar / 0.12 psig to the minimum Token Relief value listed.

3. Token Relief is not available for the Type CSB454.

Example: If a non-standard setpoint is needed, see the following example for instruction in using Table 8.
Non-standard setpoint = 140 mbar / 2 psig, then the factory set of the token relief will be 1.3*140 = 182 mbar / 2.6 psig. The factory OPSO and UPSO set values will be 165% of set and 50% of set, respectively, resulting is values of 231 mbar / 3.4 psig and 70 mbar / 1 psig, also respective to OPSO and UPSO.

Bulletin 71.1:CSB400

Capacity Information

Tables 9 through 28 provide natural gas regulating capacities at selected inlet pressures and outlet pressure settings for the CSB400 Series, which includes configurations that include the Integral Monitor and Slam-shut. Flows are in SCMh (16°C and 1.01325 bar) and SCFH (60°F and 14.7 psia) of 0.6 specific gravity natural gas. To determine equivalent capacities for air, propane, butane or nitrogen, multiply the capacity number in the tables by the following

appropriate conversion factor: 0.775 for air, 0.628 for propane, 0.548 for butane or 0.789 for nitrogen. For gases of other specific gravities, multiply the given capacity by 0.775 and divide by the square root of the appropriate specific gravity.

The published capacities were obtained using inlet and outlet piping the same size as the regulator body size.

GE27692

Figure 8. Types CSB400, CSB403 and CSB404 Spring Case Vent and Body Orientation

GE27692

CHOOSE VENT AND BODY POSITION FOR THE TYPES CSB403 AND CSB404, IN THE SAME WAY AS THE BASE CSB400 SERIES REGULATOR. THE VENT OF THE INTEGRAL MONITOR OR SLAM-SHUT WILL BE POINTED IN THE SAME DIRECTION AS THE PRIMARY REGULATOR. BODY POSITION WILL ALSO BE BASED ON MAIN REGULATOR AS THE SPRING BARREL OF THE INTEGRAL MONITOR OR SLAM-SHUT WILL POINT THE SAME DIRECTION AS THE PRIMARY REGULATOR.

Figure 8. Types CSB400, CSB403 and CSB404 Spring Case Vent and Body Orientation (continued)

21

Bulletin 71.1:CSB400

GE34270

- 1. MAXIMUM SPRING REMOVAL CLEARANCE FOR BOTH THE PRIMARY REGULATOR AND INTEGRAL MONITOR IS 158 mm / 6.2 in.
- 2. MAXIMUM SPRING REMOVAL CLEARANCE FOR THE SLAM-SHUT IS 80 mm / 3.1 in.
