

Rope Length Transmitter
Angular Position Transducer

Tilt Angle Sensor

Joystick

Pedal Actuated Transmitter

Wind Sensor

THE TILT ANGLE SENSOR

Detection of tilt angles on

- Cranes or excavators
- Ships and offshore facilities
- Weir traps or solar panels

stands for important measuring data as a part of the safety and control system of that type of machinery. By means of single and dual axis transmitters these angles are recorded and detected e. g. on

- levelling of installations
- angular position of a crane jib
- orientation of a weir trap or lifting platform

Encoders of that type contain inside a robust splash-proof aluminium case of IP code IP 65 to IP 69k oil-damped pendulum systems, the tilt

angle deflection of which is measured either by non-contact, inductive, optoelectronic or magnetoresistive angular transducers, depending on the application.

As an alternative to oil-damped pendulum systems we recommend use of the redundant micro-electromechanic inclinaton systems (MEMS). By means of an additional gyro sensor these systems are optimally suited to compensate interferences (such as lateral acceleration, permanent or continued vibrations or strong impacts)

The output signal, representing the tilt angles, is provided either analogue in form of current or voltage change or digitally with bus interface.

A pure switching signal in form of min/max comparators is also a suitable possibility to control important thresholds and to switch them accordingly.

HIGH IP PROTECTION

By default all magnetic or optical FSG encoders provide a casing protection between IP65 and IP67, depending on model. Special versions, e. g. magnetic encoders without own driving shaft and bearing position, can easily reach protection IP68 or IP69K. These features are especially required in the construction machinery field or commercial vehicle sector, water management or energy production.

ROBUST CASING FOR ALL AREAS

Seawater-resistant aluminium casings of our encoders usually offer sufficient protection against mechanical damages and for outdoor applications. For special applications and requirements, e. g. oil platforms, supply vessels or in the chemical industry, encoder versions with V4A stainless steel casings are available.

FLEXIBLE SIGNAL SETTING

Depending on the model, our sensors may be adjusted by user with analogue output signals, via membrane keypad or via additional control cables and thus be calibrated to angular ranges actually required.

SECURITY

The majority of FSG tilt angle transmitters is fitted with redundant sensors. Depending on the electrical circuit these sensors meet the requirements of functional safety according to ISO guidelines EN 13849 and EN61508.

SIGNAL OUTPUTS

For all sensor versions a great number of analogue and digital interfaces is available: 0 – 10V DC / 4 – 20mA / HART - interface CANopen / CANopen-safety

CUSTOMER-SPECIFIC VERSIONS

Standard versions of tilt angle sensors can be adapted - independent to quantity - to special applications and customer-specific requirements with regard to their electrical interfaces and mechanical design.

EXPLOSION PROTECTION

For use in potentially explosive environments we offer intrinsically safe tilt angle sensors of ATEX or IECEx certified design. Together with safety relevant requirements, e. g. in the oil and gas industry, we offer intrinsically safe encoders with additional SIL2 approval.

DNV / GL APPROVAL

Tilt angle transmitters for application in ships and offshore facilities often require an approval, ensuring a trouble-free operation. For that reason you will find in our range of products tilt angle transmitters with redundant analogue or digital interfaces having DNV / GL approval.
