

GEMÜ

**GEMÜ diaphragms
for aseptic and sterile applications**

The original diaphragms for GEMÜ diaphragm valves are available for various applications. They are divided into the two categories of soft elastomer and PTFE diaphragms and come with the customary GEMÜ quality:

- Tested on our in-house test rigs
- Special compound according to original GEMÜ specifications
- Production and quality control according to high GEMÜ standards
- Certified production takes place within the GEMÜ Group and at certified suppliers
- Optimised for GEMÜ seal system
- Uniform diaphragm sizes for different nominal sizes to simplify inventory and spare parts procurement

Management systems

GEMÜ is certified according to quality standard DIN EN ISO 9001:2008. This does not only apply to the German sites in Ingelfingen-Criesbach, Niedernhall-Waldzimmern and Kupferzell but also to our plant in Switzerland and the diaphragm manufacturing site in France. All German plants are also certified to the international environmental standard DIN EN ISO 14001:2004.

All valves and diaphragms are intensively tested on our own test rigs under realistic conditions. They are subjected to several static and dynamic tests because the service life of diaphragms depends on numerous interactions. To this end, there is a wide range of testing devices available, such as a state-of-the-art steam and a CIP/SIP* test rig.

Statistical tests are generally used to test external leak tightness and leak tightness across the weir. These involve checking the leak tightness at the maximum operating pressure and determining the operating pressure at which the first leaks occur. Dynamic tests are continuous stress tests where the limit values are determined depending on the diaphragm material and diaphragm size. The operating pressure for diaphragm valves, which we permit and recommend, is considerably less than the pressure at which the valves start leaking. This means additional safety for your plant. Our shut-off diaphragms sometimes achieve several million switching cycles depending upon application, material, and diaphragm size.

Depending on diaphragm type and material, dynamic vacuum tests (70 mbar absolute) are additionally carried out at ambient pressure. After the diaphragms have passed these internal tests without problems, field tests are carried out at selected customers. The diaphragms are only released for final series production and worldwide marketing after these field tests have been completed successfully.

All compounding for GEMÜ shut-off diaphragms are carried out exclusively for and according to the specifications of GEMÜ. Production is likewise carried out according to strict quality criteria within the GEMÜ Group or at selected partners with whom we have a close partnership spanning many years.

* CIP = Cleaning in Place, SIP = Sterilisation in Place

The original GEMÜ seal system

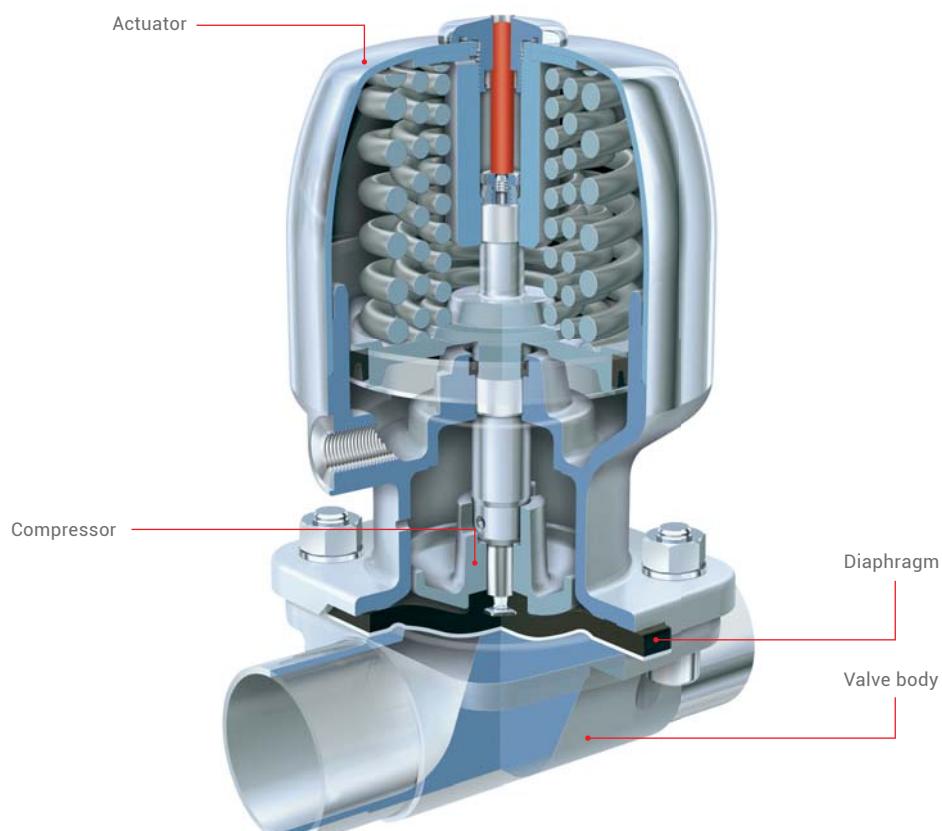

As a recognised diaphragm valve specialist, GEMÜ are familiar with almost all industrial sectors and applications. We are the leading supplier of stainless steel valves for aseptic and sterile applications in the pharmaceutical industry, biotechnology industry, as well as the foodstuff and beverage industries. As well as this, our valves also stand for reliability and a high standard of quality in the chemical and processing industries. The diaphragm, a central sealing element in the piping system is of major importance. Only the diaphragm and the valve body are in contact with the medium. At the same time, they also guarantee external hermetic sealing of the pipeline.

The system is more than the sum of the individual parts
The outstanding characteristics of the diaphragm valve are the result of the perfect interaction of tuned components. These are the valve body, the shut-off diaphragm, the diaphragm fixing, the compressor as well as the actuator. Our many years of experience and intensive dialogue with plant operators has enabled us to continue optimising the diaphragm valve design and its individual components.

Diaphragm and valve body are „inseparable“

GEMÜ valve bodies have a raised circular sealing bead on the inside diameter, in contrast to the valve bodies of other manufacturers. This results in a defined sealing edge. This measure reduces the ring-shaped gap between diaphragm and valve body in the external sealing area. This special feature makes GEMÜ diaphragm valves suitable for sterile applications. We also consider this crucial design and functional characteristic, which was developed by GEMÜ more than three decades ago and constantly refined, during the development of our diaphragms. Only this ensures that our customers can rely on the valve as a complete unit.

GEMÜ diaphragms have been developed, tested, and approved for applications with GEMÜ valve bodies. Therefore GEMÜ do not recommend or guarantee the use of other manufacturers diaphragms with GEMÜ valve bodies. We shall not accept any liability resulting from the use of diaphragms of other manufacturers inside GEMÜ diaphragm valves.

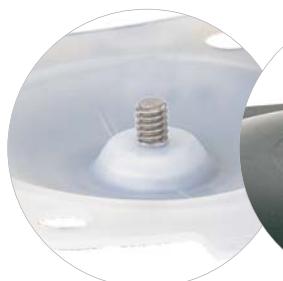

Flexible diaphragm fixing

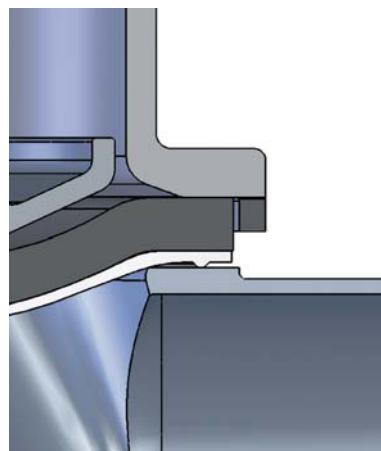

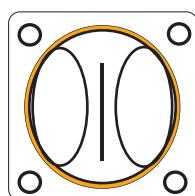

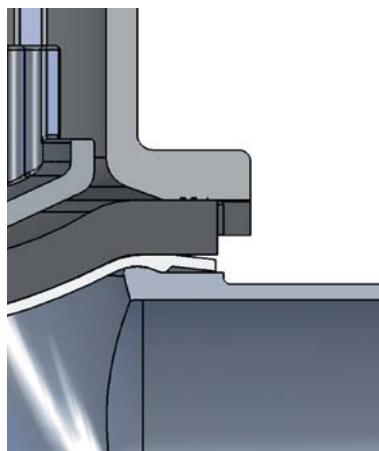

The diaphragm is uniformly fixed in the compressor by means of a threaded pin. The only exception is the smallest diaphragm size (diaphragm size 8), which is pushed in with a rubber pin. The uniform fixing method applies both to soft elastomer and PTFE diaphragms. The largest advantage of fixing by means of a threaded pin, e.g. in comparison to a bayonet fitting, is the even transfer of forces onto the large area of the flanks of the screw thread. This prevents damage to the mechanical connection between compressor and diaphragm especially under vacuum operating conditions. The uniform fixing of elastomer and PTFE diaphragms enables subsequent replacement of the diaphragm while using the same actuator.

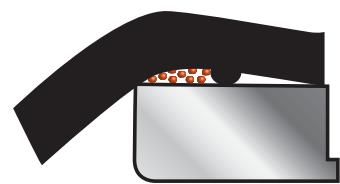

Diaphragm size 8

Diaphragm sizes 10 - 100

GEMÜ seal system

Conventional seal systems

Certificates and approvals

There is no universal diaphragm for all applications, hence we use different rubber mixtures and materials for our diaphragms. The different diaphragms have been certified according to their main fields of application so that we can certify conformity with the international regulations and rules below.

FDA (U.S. Food and Drug Administration)

FDA Extraction according to 21CFR 177.2600 for elastomers and 21CFR 177.1550 for PTFE.

USP (United States Pharmacopeia)

An independent institution has tested our diaphragms according to the regulations of the USP Class VI Chapter 87 In-Vitro and Chapter 88 In-Vivo. Furthermore, our diaphragms are free from animal ingredients.

RoHS

GEMÜ diaphragms comply with the RoHS Directive 2011/65 EC and the WEEE Directive 2002/96 EC.

Pressure Equipment Directive

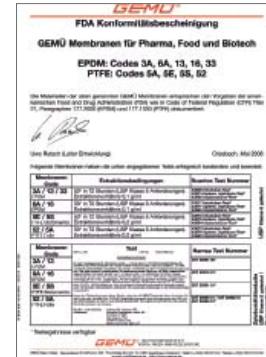

As all diaphragm valves are pressure bearing components and as the diaphragm is the central sealing element in addition to the valve body, all diaphragms also comply with the European Pressure Equipment Directive 2014/68/EU Art. 3 § 3. If no original GEMÜ shut-off diaphragms are installed, GEMÜ cannot accept any responsibility.

EAC

Certification of conformity with the standards, quality and safety standards of the customs union between Russia, Kazakhstan, Belarus, Armenia and Kyrgyzstan.

EHEDG

Hygiene standards in the foodstuff and beverage industry are continuously increasing and are approaching those of the pharmaceutical industry in sensitive areas. For this reason, the EHEDG was established some years ago (European Hygienic Engineering and Design Group). GEMÜ was the first diaphragm valve manufacturer worldwide to be granted certification for its diaphragm valve system. The examination took place in 2002.

GEMÜ diaphragms

Soft elastomer and PTFE

Soft elastomer diaphragms

Soft elastomer diaphragms consist of EPDM rubber mixtures, which are peroxidically cross-linked (vulcanised) with each other. This enables the diaphragms to be used safely, even at high media temperatures. The diaphragms are provided with different technical features dependent on the mixture used and on the processing conditions such as the duration of the cross-linking process, the vulcanisation temperature as well as the vulcanisation pressure. The following statement applies in principle to soft elastomer materials: the higher the temperature load capability, the lower the service life is in relationship to the mechanical stress. Therefore both the temperature load and the deformability of diaphragms must be optimally adjusted to the application. Different constructional designs are available to achieve this. Soft elastomer diaphragms are characterised by a high insensitivity in the case of mechanically contaminated working media, e.g. cellular lumps, solid matter or catalytic solid matter. Slurries usually do not affect the function of the valve or the seal on the valve weir. Different EPDM rubber mixtures can be selected according to the operating/sterilisation temperatures and the chemical characteristics or the working media.

Code 17, diaphragm size 25

PTFE diaphragms-Membranen

The GEMÜ PTFE diaphragms are made of a chemically modified second-generation PTFE (TFMTM*) and provide maximum chemical resistance. Even under steam conditions, PTFE diaphragms wear much more slowly than soft elastomer diaphragms. In the case of highly permeating media the structure of PTFE materials requires appropriately larger bonding thicknesses, stiffening this diaphragm version compared to pure soft elastomer diaphragms. Due to the higher rigidity the service life of the diaphragm may be reduced on high cycle duties depending on the application.

Code 5E, diaphragm size 25

GEMÜ EPDM diaphragms

Code 13 and 17

GEMÜ has developed the EPDM diaphragms code 13 and 17 for use in pharmaceutical and biotechnological applications as well as for the food and beverage industries. Both diaphragms have TA Luft (German Clean Air Act) approval. The diaphragm code 17 is especially suitable for applications with steam and for high temperatures. Both diaphragms are FDA compliant according to title 21 paragraph 177, certified according to USP Class VI, free from animal ingredients and RoHS compliant.

Features of code 13

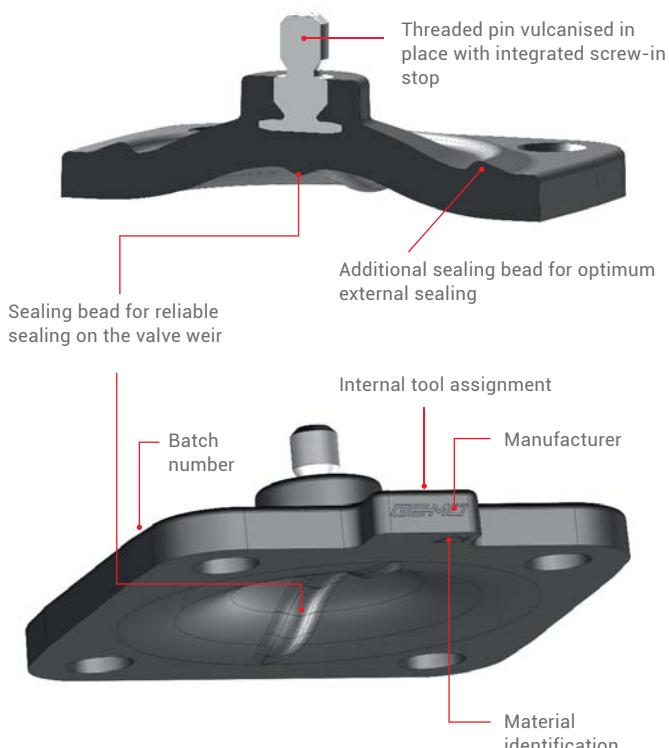

- Diaphragm with long-term reliability
- O₂ approval
- Defined assembly due to threaded pin vulcanised in place with integrated screw-in stop

Features of code 17

- Optimised for use in steam applications
- Thermal load capability (hot/cold)
- Improved long-term sealing due to contour optimisation
- Defined assembly due to threaded pin vulcanised in place with integrated screw-in stop

Technical data

- -10 to 100 °C with liquid media
- Max. 150 °C steam sterilisation depending on version for max. 180 minutes per cycle
- Available in diaphragm sizes 8 to 100

GEMÜ diaphragm code 13

GEMÜ diaphragm code 17

GEMÜ PTFE diaphragms

Code 5E (two-piece), 5A/52 (fully laminated)

The GEMÜ PTFE/EPDM diaphragms comprise a PTFE face and an EPDM back. These two components are either firmly (Code 5A/52) or flexibly (Code 5E) combined with each other.

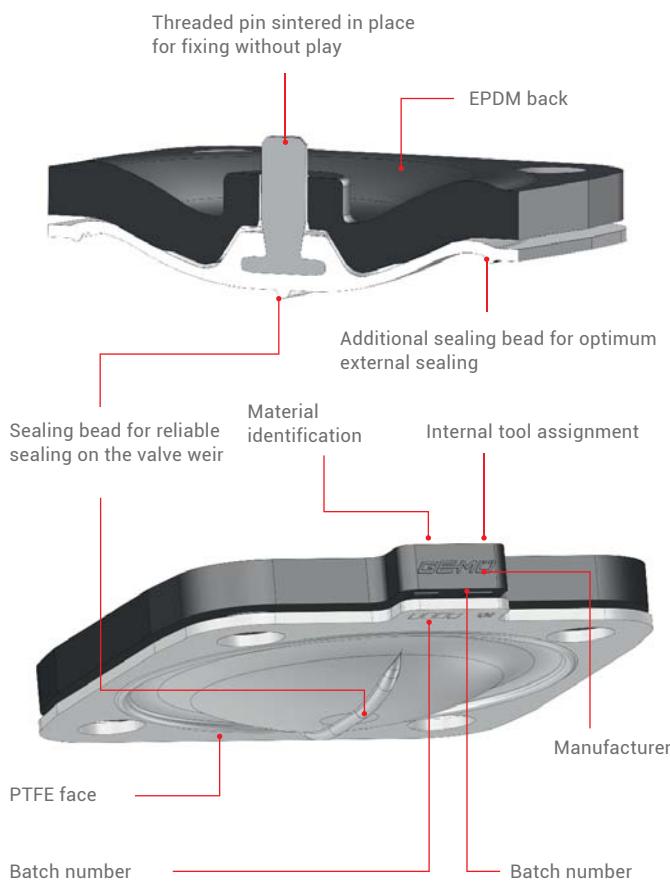

The flexible PTFE diaphragm unites all the advantages of PTFE with the flexibility of elastomer diaphragms in one product. In order to optimise the entire system again, both the PTFE face as well as the diaphragm back are compounded for GEMÜ and produced within the GEMÜ Group.

Features

- In-house development of the material composition
- Production within the GEMÜ Group
- Insensitive also at higher temperatures
- High chemical resistance due to PTFE face
- Simple and defined assembly possible
- Sintered (Code 5E) threaded pin or vulcanised (Code 5A) rubber pin
- Vulcanised (Code 52) threaded pin with integrated screw-in stop

Technical data

- -10 to 100 °C continuous operation with liquid media
- Max. 150 °C steam sterilisation without any time limit per cycle
- Available in diaphragm sizes 8 to 100

GEMÜ diaphragm code 5E

GEMÜ diaphragm code 52

GEMÜ diaphragms

Selection

Diaphragm	Material/Design	Diaphragm size	Temperature range [°C]			Code
			Min.	Max.	Sterilisation ¹	
EPDM	Ethylene-propylene-diene rubber	8 - 100	-10	100	max. 150 °C ² max. 60 min. per cycle	13/3A
EPDM	Ethylene-propylene-diene rubber	8 - 100	-10	100	max. 150 °C ² max. 180 min. per cycle	17
PTFE/EPDM	Fully laminated PTFE diaphragm with EPDM back	8, 10, 100	-10	100	max. 150 °C ² , no time limit per cycle	52/5A
PTFE/EPDM	Convex two-piece PTFE diaphragm with loose EPDM back	25, 40, 50, 80	-10	100	max. 150 °C ² , no time limit per cycle	5E

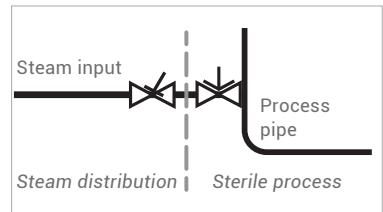

¹ The sterilisation temperature is valid for steam (saturated steam) or superheated water.

² If the sterilisation temperatures listed above are applied to the EPDM diaphragms for longer periods of time, the service life of the diaphragms will be reduced. In these cases, maintenance cycles must be adapted accordingly. This also applies to PTFE diaphragms exposed to high temperature fluctuations.

PTFE diaphragms can also be used as moisture barriers; however, this will reduce their service life. The maintenance cycles must be adapted accordingly.

GEMÜ 555 and 505 globe valves are particularly suitable for use in the area of steam generation and distribution.

The following valve arrangement for interfaces between steam pipes and process pipes has proven itself over time: A globe valve for shutting off steam pipes and a diaphragm valve as an interface to the process pipes.

Each application must be analysed before the selection of the diaphragm material. Since the most varied operating conditions often prevail within a plant at different locations, it can be necessary to use different valves and materials. In particular, the chemical characteristics and the temperature of the working media often lead to different interactions. The suitability of the materials used must therefore always be examined individually with regard to the current resistance list or checked by an authorised specialist. Only this procedure guarantees that the application will operate safely and economically for a longer period.

Diaphragms are wearing parts. They need to be regularly inspected and replaced otherwise malfunctions can occur, possibly resulting in hazardous situations. Please note: The maintenance intervals for inspecting and replacing diaphragms are application-dependent. In order to determine a suitable maintenance interval, the maintenance history and the stresses placed on the parts due to frequent sterilisation or frequent cycle duties must be taken into account.

Note

Since plastics and elastomers are subject to natural aging, we recommend observing the GEMÜ storage conditions for shut-off diaphragms. You thereby guarantee maximum storage and service life of the diaphragms.

The temperatures specified above are merely the permissible temperature ranges for the respective diaphragm. The permissible temperature ranges of the valve must always be taken into account for the overall valve design. These can be found in the respective datasheets.

The temperature values are indicated irrespective of operating pressure and diaphragm size and apply to water and/or inert gases. When using water vapour or saturated steam, observe the steam pressure diagram.

Certificates and approvals

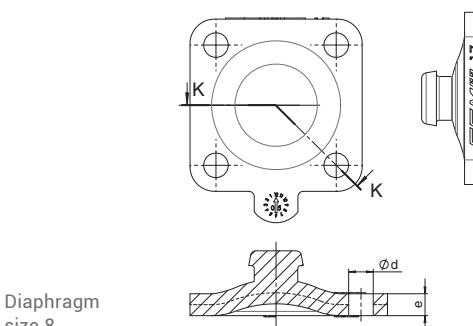

FDA compliant	USP Class VI	EHEDG	TA Luft (German Clean Air Act)	O ₂ BAM	Compatibility with media	Special features
•	•	•	•	•	Very good all-round elastomer, resistant to many acidic and alkaline media, demineralised and deionised hot water, inert and many other industrial gases.	Suitable for vacuum, low gas permeability, applicable for steam sterilisation.
•	•	•	•			Compound and construction of the diaphragm have been specially optimised for steam applications, clearly improved service life.
•	•	•	•	•		Fully laminated diaphragm, can be used in steam. Low gas permeability.
•	•	•	•	•	Resistant to nearly all chemicals, such as strong acids, alkalis and salts, also at high temperatures, steam, WFI as well as pharmaceuticals. Good resistance to solvents, chlorine, and aromatic hydrocarbons.	Convex two-piece diaphragm with loose PTFE face for higher switching cycles, can be used for permanent steam application. Special compounding and production by GEMÜ. Special seal contour for external sealing on the bottom of the diaphragm. Low gas permeability.

Diaphragm expertise

Manufacture and documentation

GEMÜ leaves nothing to chance in the development and manufacture of diaphragms. As well as many years of experience in the field of diaphragm valves, GEMÜ can draw on the group's ever increasing expertise in the field of diaphragm production. In addition to developing compounds, this also includes producing and permanent controlling the diaphragms during the manufacturing process. Random sampling of the finished products completes the comprehensive test cycle.

GEMÜ ensures its usual diaphragm quality thanks to the following measures:

- Raw materials are sourced exclusively from selected suppliers
- Comprehensive testing of the raw materials in our in-house laboratory or in external, accredited institutions
- Storage of raw materials under controlled conditions
- Automated testing and documentation processes during production
- State-of-the-art production facilities
- The diaphragms are tested on our own test rigs (includes special test cycles for the pharmaceutical industry)

Manufacture of diaphragms

The right process depending on the components:

- Manufacture of elastomer parts using vacuum injection and compression moulding
- Manufacture of PTFE parts in a sintering mould under cleanroom conditions
- Manufacture of solid elastomer compounds with metal, PTFE, fabric, etc.

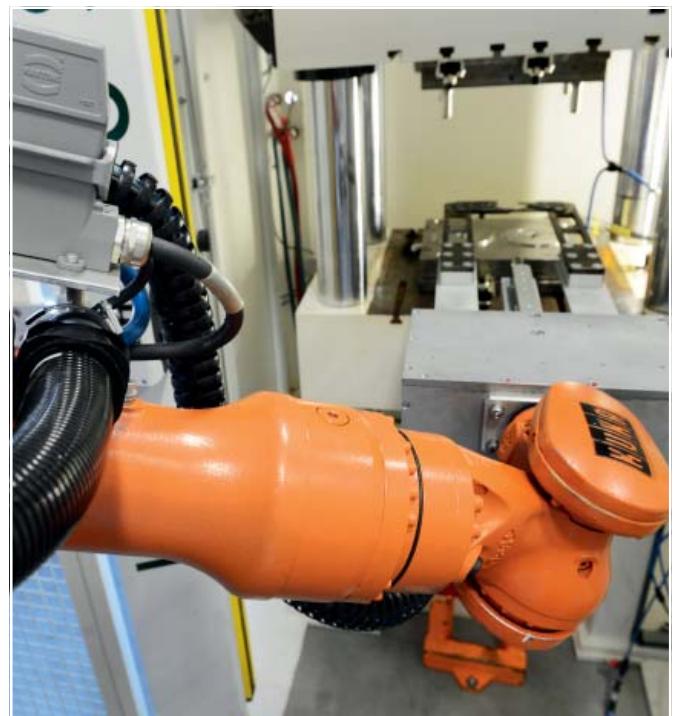

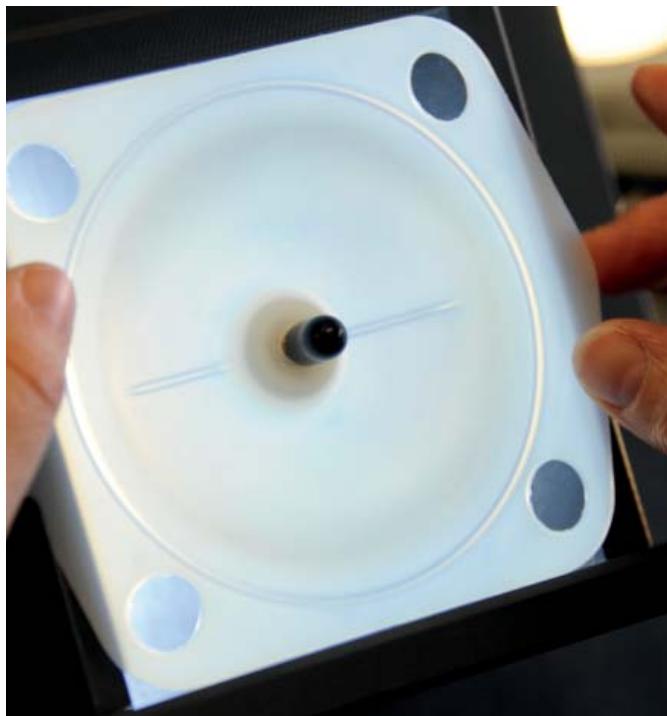

The GEMÜ group has a wide range of machinery for elastomer production, including:

- Compression machines
- Injection moulding machines
- Punch presses
- Annealing furnaces

The group also has machinery for the field of PTFE manufacture, including:

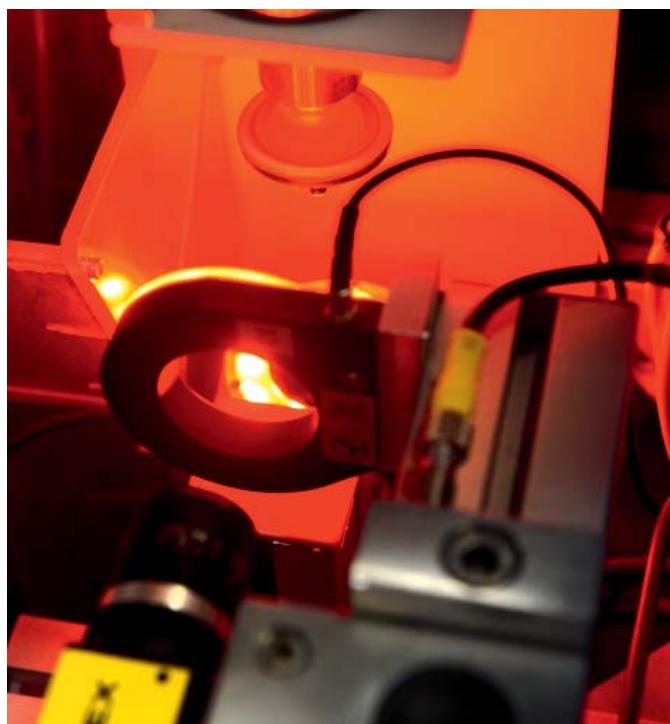

- 5-axis presses
- Sintering furnaces
- Equipment for quenching process

There is also an ISO class 9 cleanroom available for the PTFE sector.

Production examination and documentation

- Inspection of the raw material provided as per test certificate
- Testing the Shore hardness
- Testing using vulcametry (statistical and permanent process control during vulcanising)
- Statistical and permanent process control during tempering (monitoring the temperature, retention time, temperature profile, humidity and other parameters that can affect the quality of the final product)
- Measuring the threaded pin, position and length in the finished diaphragm
- Pull-out resistance of the diaphragm pin
- Dimensional accuracy of the diaphragm, diaphragm thickness, width, length and height
- 100 % visual inspection

Storage and service life of elastomer components

Correct storage, such as that described in ISO 2230 is essential for a product to achieve its specified service life. Please observe the pertinent standards.

Our customers can continue to make full use of elastomer products manufactured by us and our qualified suppliers as long as the elapsed time since production has not exceeded the period stated in the table. The max. storage period refers to the year of production. The date of manufacture can be based on the batch number, which in the form of an embossing is applied to the diaphragm can be determined. The batch number consists of the production lot of the production and the year of manufacture. The exact date of manufacture can be determined by quoting the batch number via a request to GEMÜ.

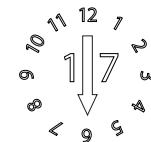

Specific measures must be implemented in order to store the diaphragms.

- Temperature below 25 °C, preferably 15 °C, but not below -10 °C
- Protection from light, in particular from light with a high UV component (e.g. sunlight)
- Relative humidity below 65 %
- The storage space must not contain any ozone-producing equipment (e.g. electric motors), or solvents, fuels, chemicals, etc.
- Do not use films containing plasticizers for packaging
- The diaphragms must be stored stress-free, i.e. without tension, pressure or other deformation; for example, they must not be suspended from any part of the edge of their circumference

Elastomers are organic materials; they can be damaged by external influences such as oxygen, ozone, heat, etc. The measures listed above are necessary for achieving the maximum storage time.

Examples batch number

Replacement diaphragms

Replacement diaphragms can be ordered as loose items using the following article numbers. For reasons of traceability, we also offer you the option of ordering the diaphragms individually packed and labelled, along with the corresponding inspection certificates.

Diaphragm size	Article number loose	Article designation	Article number Only for type 660	Article designation	Article number individually packed	Article designation

Training and Service

Our team from the „Technical Training“ department offers GEMÜ customers various training courses on the subject of diaphragm valves and the changing of diaphragms. These training courses can be carried out at GEMÜ's Ingelfingen-Criesbach site or on-site at the customer's premises.

Would you like assistance when you carry out your first diaphragm change?

Contact GEMÜ. Our team from the „Technical Service“ department will be happy to help you.
