1 Introduction

This technical file contains detailed descriptions on the safe and proper installation, connection, commissioning and monitoring of the product.

It also includes safety instructions and general information about the product.

This technical file is intended solely for specially trained and authorized personnel.

1.1 Manufacturer

The product is manufactured by:

Maschinenfabrik Reinhausen GmbH

Falkensteinstraße 8
93059 Regensburg, Germany
Tel.: (+49) 9 41/40 90-0
Fax: (+49) 9 41/40 90-7001
E-mail: sales@reinhausen.com

Further information on the product and copies of this technical file are available from this address if required.

1.2 Subject to change without notice

The information contained in this technical file comprises the technical specifications approved at the time of printing. Significant modifications will be included in a new edition of the technical file.

The document number and version number of this technical file are shown in the footer.

1.3 Completeness

This technical file is incomplete without the supporting documentation.

1.4 Safekeeping

Keep this technical file and all supporting documents ready at hand and accessible for future use at all times.

1.5 Notation conventions

This section contains an overview of the symbols and textual emphasis used.

1.5.1 Hazard communication system

Warnings in this technical file are displayed as follows.

1.5.1.1 Warning relating to section

Warnings relating to sections refer to entire chapters or sections, sub-sections or several paragraphs within this technical file. Warnings relating to sections use the following format:

▲ WARNING

Type of danger!

Source of the danger and outcome.

- Action
- Action

1.5.1.2 Embedded warning information

Embedded warnings refer to a particular part within a section. These warnings apply to smaller units of information than the warnings relating to sections. Embedded warnings use the following format:

▲ DANGER! Instruction for avoiding a dangerous situation.

1.5.1.3 Signal words and pictograms

The following signal words are used:

Signal word	Meaning
DANGER	Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
WARNING	Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
CAUTION	Indicates a hazardous situation which, if not avoided, could result in injury.
NOTICE	Indicates measures to be taken to prevent damage to property.

Table 1: Signal words in warning notices

Pictograms warn of dangers:

Pictogram	Meaning
	Warning of a danger point
	Warning of dangerous electrical voltage
	Warning of combustible substances
	Warning of danger of tipping

Table 2: Pictograms used in warning notices

1.5.2 Information system

Information is designed to simplify and improve understanding of particular procedures. In this technical file it is laid out as follows:

Important information.

1.5.3 Instruction system

This technical file contains single-step and multi-step instructions.

Single-step instructions

Instructions which consist of only a single process step are structured as follows:

Aim of action

✓ Requirements (optional).

► Step 1 of 1.

⇒ Result of step (optional).

⇒ Result of action (optional).

Multi-step instructions

Instructions which consist of several process steps are structured as follows:

Aim of action

✓ Requirements (optional).

1. Step 1.

⇒ Result of step (optional).

2. Step 2.

⇒ Result of step (optional).

⇒ Result of action (optional).

1.5.4 Typographic conventions

The following typographic conventions are used in this technical file:

Typographic convention	Purpose	Example
UPPERCASE	Operating controls, switches	ON/OFF
[Brackets]	PC keyboard	[Ctrl] + [Alt]
Bold	Software operating controls	Press Continue button
...>...>...	Menu paths	Parameter > Control parameter
<i>Italics</i>	System messages, error messages, signals	<i>Function monitoring alarm triggered</i>
[▶ Number of pages].	Cross reference	[▶ 41].

Table 3: Typographic conventions

2 Safety

2.1 General safety information

The technical file contains detailed descriptions on the safe and proper installation, connection, commissioning and monitoring of the product.

- Read this technical file through carefully to familiarize yourself with the product.
- Particular attention should be paid to the information given in this chapter.

2.2 Appropriate use

If used as intended and in compliance with the requirements and conditions specified in this technical document as well as with the warnings in this technical document and attached to the product, then the product does not present any danger to people, property or the environment. This applies throughout the product's entire life, from delivery through installation and operation to disassembly and disposal.

The operational quality-assurance system ensures a consistently high quality standard, particularly in regard to the observance of health and safety requirements.

The following is considered appropriate use

- The product must be operated in accordance with this technical file and the agreed delivery conditions and technical data
- The equipment and special tools supplied must be used solely for the intended purpose and in accordance with the specifications of this technical file

2.3 Inappropriate use

Use is considered to be inappropriate if the product is used other than as described in the Appropriate use section. Please also note the following:

- Risk of explosion and fire from highly flammable or explosive gases, vapors, or dusts. Do not operate product in areas at risk of explosion.
- Unauthorized or inappropriate changes to the product may lead to personal injury, material damage, and operational faults. Only modify product following discussion with Maschinenfabrik Reinhausen GmbH.

2.4 Personnel qualification

The product is designed solely for use in electrical energy systems and facilities operated by appropriately trained staff. This staff comprises people who are familiar with the installation, assembly, commissioning and operation of such products.

2.5 Operator's duty of care

To prevent accidents, disruptions and damage as well as unacceptable adverse effects on the environment, those responsible for transport, installation, operation, maintenance and disposal of the product or parts of the product must ensure the following:

- All warning and hazard notices are complied with.
- Personnel are instructed regularly in all relevant aspects of operational safety, the operating instructions and particularly the safety instructions contained therein.
- Regulations and operating instructions for safe working as well as the relevant instructions for staff procedures in the case of accidents and fires are kept on hand at all times and are displayed in the workplace where applicable.
- The product is only used when in a sound operational condition and safety equipment in particular is checked regularly for operational reliability.
- Only replacement parts, lubricants and auxiliary materials which are authorized by the manufacturer are used.
- The specified operating conditions and requirements of the installation location are complied with.
- All necessary devices and personal protective equipment for the specific activity are made available.
- The prescribed maintenance intervals and the relevant regulations are complied with.
- Installation, electrical connection and commissioning of the product may only be carried out by qualified and trained personnel in accordance with this technical file.
- The operator must ensure appropriate use of the product.

3 IT security

Observe the following recommendations to operate the product safely.

General

- Ensure that only authorized personnel have access to the device. Use the device door lock for this purpose.
- Only use the device within an ESP (electronic security perimeter). Do not connect the device to the Internet in an unprotected state.
- Ensure that the device is only operated by trained personnel who are familiar with IT security.
- Do not assign any passwords that are easy to guess. The password should consist of upper-case letters, lower-case letters and numbers and should be 8 characters long.

Commissioning

Observe the following recommendations for device commissioning:

- Set the password duration to 5 minutes or less [► Section 8.2.12, Page 59].
- Assign a password for the COM1 front interface [► Section 8.2.11, Page 58].

Operation

Observe the following recommendations during device operation:

- Do not leave the device unattended when the entered password is active. The password entered is active if the *Parallel operation* LED flashes.
- Change the password at regular intervals.

4 Product description

This chapter contains an overview of the design and function of the product.

4.1 Scope of delivery

The following components are included in the delivery:

- Voltage Regulator TAPCON® 230 basic
- Folder with all device documentation
- Quick reference guide (in the inside door of the device)
- Door key
- 3mm Allen key
- 2 countersunk head screws
- Control panel bracket pre-mounted on device's housing

Figure 1: Control panel bracket

- Mounting bracket for wall mounting

Figure 2: Mounting bracket

- Covering strip for door

Figure 3: Covering strip

Optional:

- Cap rail clip

Figure 4: Cap rail clip

Please note the following:

- Check the shipment for completeness on the basis of the shipping documents.
- Store the parts in a dry place until installation.

4.2 Function description of the voltage regulation

The TAPCON® serves to keep constant the output voltage of a transformer with an on-load tap-changer.

The TAPCON® compares the transformer's measured voltage (U_{actual}) with a defined reference voltage (U_{desired}). The difference between U_{actual} and U_{desired} is the control deviation (dU).

The TAPCON® parameters can be optimally adjusted to the line voltage response to achieve a balanced control response with a small number of tap-change operations.

The following diagram shows an overview of voltage regulation.

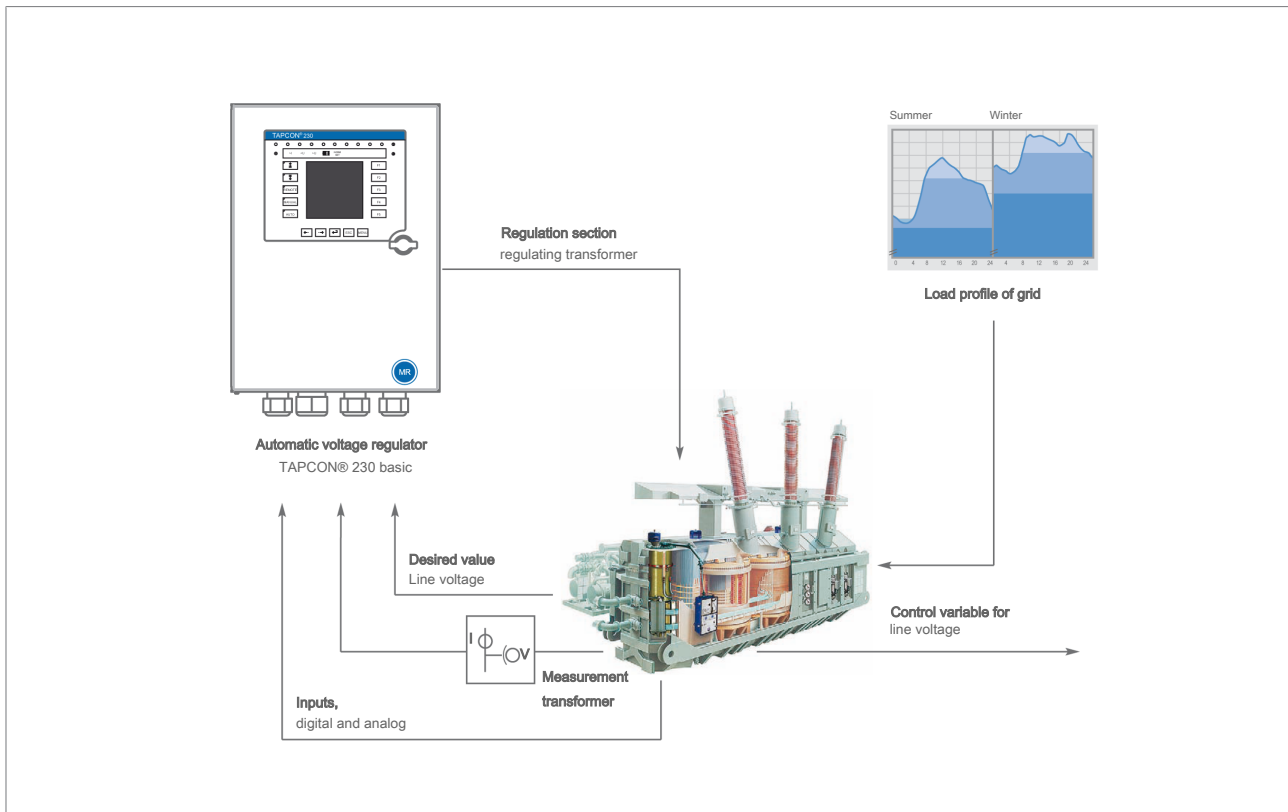

Figure 5: Overview of voltage regulation

4.3 Performance features

The TAPCON® is responsible for controlling tapped transformers.

Apart from control tasks, the TAPCON® provides additional functions such as:

- Integrated monitoring functions:
 - Undervoltage blocking and overvoltage blocking
 - Overvoltage detection with high-speed return
- Compensation for voltage drops on the line (line drop compensation)
- Compensation for voltage fluctuations in the meshed grid (Z compensation)
- Digital inputs and outputs can be individually programmed on-site by the customer
- Additional indicators using LEDs outside the display for freely selectable functions
- Display of all measured values such as voltage, current, active power, apparent power or reactive power, power factor ($\cos \varphi$)
- Selection of 3 different desired values

4.4 Operating modes

The device can be operated in the following operating modes:

Auto mode (AUTO)

In auto mode, the voltage is automatically controlled in accordance with the set parameters. You cannot change further device settings in auto mode. There is no active management by a higher level control system in this operating mode.

Manual mode (MANUAL)

In manual mode, there is no automatic control. The motor-drive unit can be controlled via the device's operating panel. You can change the device settings.

Local mode (LOCAL)

There is no active management by a superordinate control system in this operating mode.

Remote mode (REMOTE)

In remote mode, you can perform commands using an external control level.

In this case, manual operation of the , ,  and  keys is disabled.

	 + LOCAL	 + REMOTE	 + LOCAL	 + REMOTE
Automatic regulation	Yes	Yes	No	No
Tap-change operation using operating controls	No	No	Yes	No
Tap-change operation using inputs	No	No	No	Yes

Table 4: Overview of operating modes

4.5 Hardware

Figure 6: Hardware

1 Operating panel with display and LEDs

2 Door lock

3 Door

4 Metric cable glands

4.5.1 Name plate

The name plate is on the outside of the device:

Figure 7: Name plate

4.5.2 Operating controls

The device has 15 pushbuttons. The illustration below is an overview of all the device's operating controls.

Figure 8: Operating controls

RAISE key: Sends control command for raise tap-change to the motor-drive unit in manual mode.

LOWER key: Sends control command for lower tap-change to the motor-drive unit in manual mode.

REMOTE key: Activate/deactivate "Remote" operating mode. When you deactivate this operating mode, the "Local" operating mode is automatically activated.

MANUAL key: Activate "Manual mode" operating mode.

AUTO key: Activate "Auto mode" operating mode.

PREV key: Change measured value display and switch to previous parameters.

NEXT key: Change measured value display and switch to next parameters.

ENTER key: Confirm selection and save modified parameters.

ESC key: Escape current menu and select previous menu levels.

MENU key: Select main menu.

F1 to F5 function keys: Select functions displayed on the screen.

4.5.3 Display elements

The device has a graphics display and 15 LEDs, which indicate the various operating statuses or events.

Figure 9: Indicator elements

1 <i>Operating status</i> LED, green	9 LED 3, function can be freely assigned, yellow/green
2 <i>Overcurrent blocking</i> LED, red	10 LED 4, function can be freely assigned, yellow/red
3 <i>Undervoltage blocking</i> LED, red	11 Graphics display
4 <i>Overvoltage blocking</i> LED, red	12 <i>Auto operating mode active</i> LED
5 <i>Parallel operation active</i> LED, green	13 <i>Manual operating mode active</i> LED
6 <i>NORMset active</i> LED, green	14 <i>Remote operating mode active</i> LED
7 LED 1, function can be freely assigned, yellow	15 <i>Lower tap-change active</i> LED
8 LED 2, function can be freely assigned, yellow	16 <i>Raise tap-change active</i> LED

Display

Figure 10: Display

1 Status line	6 Time bar for delay time T1
2 Measured voltage U_{Act}	7 Highlighting for measured voltage U_{Act}
3 Reference voltage U_{Ref}	8 Highlighting for reference voltage U_{Ref}
4 Other measured values (use \rightarrow or \leftarrow to switch between them)	9 Remaining delay time T1
5 Bandwidth (upper and lower limit)	

Other measured values In auto mode and manual mode the measured value display **4** can be set using the \rightarrow or \leftarrow keys. The following measured values can be displayed:

Unit	Measured value
ΔU	Control deviation
I	Current
S	Apparent power
P	Active power
Q	Reactive power

Unit	Measured value
Phase	Phase angle
Cos	Cosine

Table 5: Measured value display

Status line Current messages and events are displayed in the status line **1**. You can find more information about messages and events in the Messages chapter.

4.5.4 Serial interface

The parameters for the device can be set using a PC. The COM 1 (RS232) serial interface on the front panel is provided for this purpose. You can use the connection cable supplied to establish a connection to your PC via the RS232 or USB port (using the optional USB adapter).

TAPCON®-trol software is needed for parameterization via the serial interface. The software and the associated user guide can be downloaded from www.reinhausen.com.

Figure 11: Device connection to a PC

4.5.5 MIO card module

The device has an internal module. Carry out wiring in accordance with the supplied connection diagram.

Figure 12: MIO card

1 Relay outputs (terminal X4)

4 Current transformer connection
(terminal X1)

2 Signal inputs (terminal X4)

5 Voltage transformer connection
and network connection (terminal
X2)

3 Relay outputs (terminal X3)

5 Packaging, transport and storage

5.1 Packaging

5.1.1 Purpose

The packaging is designed to protect the packaged goods during transport, loading and unloading as well as periods of storage in such a way that no (detrimental) changes occur. The packaging must protect the goods against permitted transport stresses such as vibration, knocks and moisture (rain, snow, condensation).

The packaging also prevents the packaged goods from moving impermissibly within the packaging. The packaged goods must be prepared for shipment before actually being packed so that the goods can be transported safely, economically and in accordance with regulations.

5.1.2 Suitability, structure and production

The goods are packaged in a sturdy cardboard box. This ensures that the shipment is secure when in the intended transportation position and that none of its parts touch the loading surface of the means of transport or touch the ground after unloading.

The box is designed for a maximum load of 10 kg.

Inlays inside the box stabilize the goods, preventing impermissible changes of position, and protect them from vibration.

5.1.3 Markings

The packaging bears a signature with instructions for safe transport and correct storage. The following symbols apply to the shipment of non-hazardous goods. Adherence to these symbols is mandatory.

				
Protect against moisture	Top	Fragile	Attach lifting gear here	Center of mass

Table 6: Shipping pictograms

5.2 Transportation, receipt and handling of shipments

In addition to oscillation stress, jolts must also be expected during transportation. In order to prevent possible damage, avoid dropping, tipping, knocking over and colliding with the product.

If a crate tips over, falls from a certain height (e.g. when slings tear) or is subject to an unbroken fall, damage must be expected regardless of the weight.

Every delivered shipment must be checked for the following by the recipient before acceptance (acknowledgment of receipt):

- Completeness based on the delivery slip
- External damage of any type

The checks must take place after unloading when the crate or transport container can be accessed from all sides.

Visible damage If external transport damage is detected on receipt of the shipment, proceed as follows:

- Immediately record the transport damage found in the shipping documents and have this countersigned by the carrier.
- In the event of severe damage, total loss or high damage costs, immediately notify the sales department at Maschinenfabrik Reinhausen and the relevant insurance company.
- After identifying damage, do not modify the condition of the shipment further and retain the packaging material until an inspection decision has been made by the transport company or the insurance company.
- Record the details of the damage immediately onsite together with the carrier involved. This is essential for any claim for damages!
- If possible, photograph damage to packaging and packaged goods. This also applies to signs of corrosion on the packaged goods due to moisture inside the packaging (rain, snow, condensation).
- Be absolutely sure to also check the sealed packaging.

Hidden damage When damages are not determined until unpacking after receipt of the shipment (hidden damage), proceed as follows:

- Make the party responsible for the damage liable as soon as possible by telephone and in writing, and prepare a damage report.
- Observe the time periods applicable to such actions in the respective country. Inquire about these in good time.

With hidden damage, it is very hard to make the transportation company (or other responsible party) liable. Any insurance claims for such damages can only be successful if relevant provisions are expressly included in the insurance terms and conditions.

5.3 Storage of shipments

When selecting and setting up the storage location, ensure the following:

- Protect stored goods against moisture (flooding, water from melting snow and ice), dirt, pests such as rats, mice, termites and so on, and against unauthorized access.
- Store the crates on timber beams and planks as a protection against rising damp and for better ventilation.
- Ensure sufficient carrying capacity of the ground.
- Keep entrance paths free.
- Check stored goods at regular intervals. Also take appropriate action after storms, heavy rain or snow and so on.

6 Mounting

This chapter describes how to correctly install and connect the device. Observe the connection diagrams provided.

DANGER

Electric shock!

Risk of fatal injury due to electrical voltage. Always observe the following safety regulations when working in or on electrical equipment.

- ▶ Disconnect the equipment.
- ▶ Lock the equipment to prevent an unintentional restart.
- ▶ Make sure all poles are de-energized.
- ▶ Ground and short-circuit.
- ▶ Cover or cordon off adjacent energized parts.

WARNING

Electric shock!

Dangerous high voltages may occur when a current transformer is operated with an open secondary circuit. This can lead to death, injuries and property damage.

- ▶ Never operate a current transformer with an open secondary circuit; short-circuit the current transformer to prevent this.
- ▶ Observe the information in the current transformer operating instructions.

NOTICE

Damage to the device!

Electrostatic discharge may cause damage to the device.

- ▶ Take precautionary measures to prevent the build-up of electrostatic charges on work surfaces and personnel.

6.1 Preparation

The following tools are needed for mounting:

- Provided 3mm Allen key (included in delivery)
- Small screwdriver for connecting the signal lines and supply lines

Other tools may be needed depending on installation location.

6.2 Mounting device

You can mount the device in the following installation versions:

- Flush panel mounting
- Wall mounting

- Wall mounting with mounting brackets
- Rail mounting (optional)

Preparing for mounting

Before commencing mounting, the two mounting brackets back on the rear of the device must be removed and the cable gland plate taken off. To do so, proceed as follows:

1. Loosen the 4 Allen screws with attached Allen key to remove the mounting brackets.

Figure 13: Loosen mounting bracket

2. Loosen the 4 Allen screws with attached Allen key to remove the cable gland plate.

Figure 14: Loosen cable gland plate

⇒ The mounting brackets and the cable gland plate are removed.

The relevant installation versions are described in the following sections.

6.2.1 Flush panel mounting

For flush panel mounting, the device is inserted through a cutout in the control panel and fixed to the control panel or control cabinet from behind using the mounting brackets. The diagram below shows the dimensions required for the control panel cutout.

Figure 15: Dimensions for the cutout

A wall thickness of 2...5 mm (0.08...0.2 in) is needed for secure device fixing.

To mount the device in the control panel or control cabinet, proceed as follows:

1. Close the device's door.
2. Insert the device through the cutout in the control panel or control cabinet **1**.
3. Screw both fixing brackets to the rear of the device with 2 hexagon socket screws each **2**.

Figure 16: Flush panel mounting

⇒ The device is mounted and can be wired up **3**.

Proceed with wiring as shown in the connection diagram and as described in the Connecting device [► Section 6.3, Page 34] section.

6.2.2 Wall mounting with mounting brackets

As an alternative to mounting the device directly on the wall, it can be fixed to the wall using the mounting brackets supplied.

Drill 4 holes, each 5.5 mm (0.22 in) in diameter, in the wall as shown in the drilling template below.

Figure 17: Bores for wall mounting with mounting brackets

To mount the device using the mounting brackets, proceed as follows:

1. Lay the device carefully on the door.
2. Screw the mounting brackets supplied to the back of the device using the hexagon socket screws **1**.
3. Fix the device on the wall using 4 screws (maximum diameter of 5 mm/0.22 in) **2**.

The screws for fixing to the wall are not included in the scope of supply. The screw length required depends on the wall thickness.

Figure 18: Wall mounting with mounting brackets

⇒ The device is mounted and can be wired up **3**.

Proceed with wiring as shown in the connection diagram and as described in the Connecting device [► Section 6.3, Page 34] section.

6.2.3 Cap rail mounting

As an option, the device can be fitted with a cap rail clip (aluminum extrusion with wire spring integrated at center). This enables you to mount the device on a cap rail.

When attaching the cap rail, sufficient space for the device must be planned for. At least 5 cm (1.97 in) of space must be provided above and at least 35 cm (13.78 in) below the fixing screws of the cap rail for the device housing.

To mount the device using the cap rail, proceed as follows:

1. Lay the device carefully on the door.
2. Screw the cap rail clip into the two top holes on the rear with the M5 hexagon socket countersunk head screws provided **1**.
3. Suspend the cap rail clip in the cap rail and push the underside carefully towards the wall until the clip can be heard to click into place **2**.

Figure 19: Cap rail mounting

⇒ The device is mounted and can be wired up **3**.

Proceed with wiring as shown in the connection diagram and as described in the Connecting device [► Section 6.3, Page 34] section.

6.2.4 Wall mounting

For wall mounting, the device is fixed directly to the wall. Drill 4 holes, each 5.5 mm in diameter, in the wall as shown in the drilling template below.

Figure 20: Drilling template for wall mounting

To mount the device directly on the wall, proceed as follows:

✓ Close the device's door.

► Fix the device on the wall from behind using 4 screws (M5) **2**.

The screws for wall mounting are not included in the scope of supply. The screw length required depends on the wall thickness.

Figure 21: Wall mounting

⇒ The device is mounted and can be wired up **3**.

Proceed with wiring as shown in the connection diagram and as described in the Connecting device section.

6.2.5 Removing the door

When the door is fitted, the device satisfies protection category IP54. The door may be removed if the device is used solely in a dry atmosphere protected from environmental influences. The device then satisfies protection category IP21.

Proceed as follows to remove the door:

1. Loosen the grounding strap on the door using an open-end wrench.

Figure 22: Remove door

2. Unscrew the fixing bolt using a slotted screwdriver and **1** lift the door out of the upper mounting **2**.

Figure 23: Lift door from the suspension mount

3. Hook the cover strip in the upper **1** and lower **2** suspension mount and fasten it with the provided raised countersunk head screws.

Figure 24: Fasten covering strip

⇒ The door is removed and the exposed attachment points for the door are covered.

6.3 Connecting device

The following section describes how to establish the electrical connection to the device.

⚠ WARNING

Electric shock!

Connection errors can lead to death, injury or property damage.

- ▶ Ground the device with a protective conductor using the grounding screw on the housing.
- ▶ Note the phase difference of the secondary terminals for the current transformer and voltage transformer.
- ▶ Connect the output relays correctly to the motor-drive unit.

Supply the voltage via separators and ensure that current paths can be short circuited. Fit the separator, clearly labeled, close to the device's power supply so that it is freely accessible. This ensures that the device can be replaced with ease in the event of a defect.

Wiring information

Note this procedure for the wiring:

- ✓ To obtain a better overview when connecting cables, only use as many leads as necessary.
 - ✓ Note the connection diagram.
 - ✓ Use only the specified cables for wiring. Note the cable recommendation [▶ Section 6.3.1, Page 35].
 - ✓ Wire the leads to the system periphery [▶ Section 6.3.4, Page 39].
1. Strip insulation from leads and wires.

2. Crimp stranded wires with wire end sleeves.

6.3.1 Cable recommendation

Please note the following recommendation from Maschinenfabrik Reinhausen when wiring the device.

Excessive line capacitance can prevent the relay contacts from breaking the contact current. In control circuits operated with alternating current, take into account the effect of the line capacitance of long control cables on the function of the relay contacts.

Cable	Terminal	Cable type	Wire cross-section	Max. length	Max. permissible torque
Signal inputs	X4	Shielded	1.5 mm ²	-	0.6 Nm
RS232 SUB-D	-	Shielded	0.25 mm ²	25 m	-
Relay outputs*	X3	Unshielded	1.5 mm ²	-	0.6 Nm
Relay outputs* optional	X4	Unshielded	1.5 mm ²	-	0.6 Nm
Current measurement	X1:5/6/9	Unshielded	4 mm ²	-	1.5 Nm
Voltage measurement	X2:1/2	Shielded	1.5 mm ²	-	0.6 Nm
Power supply	X2:3/4	Unshielded	1.5 mm ²	-	0.6 Nm

Table 7: Cable recommendation for connection cable

*) Observe line capacitance, see note above.

Cable clips X1 to X4 are on the MIO card of the device.

6.3.2 Information about laying fiber-optic cable

To ensure the smooth transfer of data via the fiber-optic cable, you must ensure that mechanical loads are avoided when laying the fiber-optic cable and later on during operation. Also observe the information from the manufacturer of the fiber-optic cable and the following instructions:

- Radii must not fall below the minimum permissible bend radii (do not bend fiber-optic cable).
- The fiber-optic cables must not be over-stretched or crushed. Observe the permissible load values.
- The fiber-optic cables must not be twisted.

- Be aware of sharp edges because they can damage the fiber-optic cable's coating during laying or can place mechanical loads on the coating later on.
- Provide a sufficient cable reserve near distributor cabinets. Lay the reserve such that the fiber-optic cable is neither bent nor twisted when tightened.

6.3.3 Electromagnetic compatibility

The device has been developed in accordance with applicable EMC standards. The following points must be noted in order to maintain the EMC standards.

6.3.3.1 Wiring requirement of installation site

Note the following when selecting the installation site:

- The system's overvoltage protection must be effective.
- The system's ground connection must comply with all technical regulations.
- Separate system parts must be joined by a potential equalization.
- The device and its wiring must be at least 10 m away from circuit-breakers, load disconnectors and busbars.

6.3.3.2 Wiring requirement of operating site

Note the following when wiring the operating site:

- Route the connecting leads in grounded metal cable ducts.
- Do not route lines which cause interference (e.g. power lines) and lines susceptible to interference (e.g. signal lines) in the same cable duct.
- Maintain a distance of more than 100 mm between lines which cause interference and those which are susceptible to interference.

Figure 25: Recommended wiring

1 Cable duct for lines causing interference

2 Line causing interference (e.g. power line)

3 Cable duct for lines susceptible to interference

4 Line susceptible to interference (e.g. signal line)

- Short-circuit and ground reserve lines.
- Never connect the device with a multi-wire collective pipe.
- For signal transmission, use shielded lines with individual conductors (outgoing conductor / return conductor) twisted in pairs.
- Connect full surface of shielding (360°) to device or to a nearby grounding bar.

Using single conductors may limit the effectiveness of the shielding. Connect close-fitting shielding to cover all areas.

Figure 26: Recommended connection of the shielding

1 Connection of the shielding via a single conductor

2 Full-surface connection of the shielding

6.3.3.3 Wiring requirement in control cabinet

Note the following when wiring the control cabinet:

- The control cabinet where the device will be installed must be prepared in accordance with EMC requirements:
 - Functional division of control cabinet (physical separation)
 - Constant potential equalization (all metal parts are joined)
 - Line routing in accordance with EMC requirements (separation of lines which cause interference and those susceptible to interference)
 - Optimum shielding (metal housing)
 - Overvoltage protection (lightning protection)
 - Collective grounding (main grounding rail)
 - Cable bushings in accordance with EMC requirements
 - Any contactor coils present must be interconnected
- The device's connection cables must be laid in close contact with the grounded metal housing or in metallic cable ducts with a ground connection.
- Signal lines and power lines/switching lines must be laid in separate cable ducts.
- The device must be grounded at the screw provided, the protective grounding connection, using a ground strap (cross-section min. 8 mm²).

Figure 27: Ground strap connection

Ground connection for wiring inside the device

The diagram below shows the ground connection for wiring inside the device.

Figure 28: Grounding inside the device

6.3.4 Connecting cables to the system periphery

To obtain a better overview when connecting cables, only use as many leads as necessary.

To connect cables to the system periphery, proceed as follows:

- ✓ Use only the specified cables for wiring. Note the cable recommendation.
- Connect the lines to be wired to the device to the system periphery as shown in the connection diagrams supplied.

6.3.5 Supplying the voltage regulator using auxiliary voltage

The device is normally supplied by the voltage transformer. If the voltage transformer does not provide the supply voltage and power (see "Technical Data") needed for operation, the device must be supplied via a 88...265V AC/DC, 50...60Hz auxiliary supply .

Proceed as follows to supply the device with auxiliary voltage:

1. **NOTICE!** Voltage transformer damage Connecting an auxiliary voltage when bridges are present between the X2:1/3 and X2:2/4 terminals can result in voltage transformer damage. Remove the bridges between the terminals X2:1/3 and X2:2/4.
2. Connect the voltage transformer to terminals X2:1 and X2:2.
3. Connect the auxiliary voltage using the following terminals: X2:3 and X2:4.

Figure 29: Voltage transformer and auxiliary supply connections

6.3.6 Wiring device

To obtain a better overview when connecting cables, only use as many leads as necessary.

To wire the device, proceed as follows:

- ✓ Use only the specified cables for wiring. Note the cable recommendation [► Section 6.3.1, Page 35].
- ✓ Wire the lines to the system periphery [► Section 6.3.4, Page 39].

1. Remove 4 hexagon socket screws from cover plate and take off cover plate.
2. Disconnect the connectors required.
3. Remove 4 hexagon socket screws from the cable gland plate and take off the cable gland plate.
4. Remove dummy plug from required cable glands in order to guide cables through.

Unnecessary cable glands must be sealed with dummy plugs to guarantee the IP54 protection category.

5. Strip insulation from lines and leads.
6. Crimp stranded wires with core cable ends.
7. Guide cables through the cable gland
8. Guide leads into corresponding connector terminals.
9. Fasten screws for the corresponding terminals using a screwdriver.
10. Guide the cable gland plate into the device opening provided for this purpose.
11. Plug connectors into the correct slots.
12. Secure cable gland plate to device housing with 4 hexagon socket screws.

6.3.7 Checking functional reliability

To ensure that the device is wired correctly, check its functional reliability.

NOTICE

Damage to device and system periphery

An incorrectly connected device can lead to damages in the device and system periphery.

- Check the entire configuration before commissioning.
- Prior to commissioning, be sure to check the actual voltage and operating voltage.

Check the following:

- Once you have connected the device to the grid, the screen displays the MR logo and then the operating screen.
- The green *Operating display* LED top left on the device's front panel lights up.

The device is fully mounted and can be configured. The actions required for this are described in the following chapter.

7 Commissioning

You need to set several parameters and perform function tests before commissioning the device. These are described in the following sections.

NOTICE

Damage to device and system periphery

An incorrectly connected device can lead to damages in the device and system periphery.

- Check the entire configuration before commissioning.
- Prior to commissioning, be sure to check the actual voltage and operating voltage.

We recommend using a device for industrial instrumentation to record the actual transformer voltage value in order to evaluate how the device is functioning.

7.1 Setting the display contrast

You can adjust the contrast in the display with the help of an adjustment screw on the front of the device. To adjust the contrast, proceed as follows:

- Use a screwdriver to turn the adjustment screw on the front until the contrast is adjusted to the desired setting.

Figure 30: Setting the display contrast

7.2 Setting parameters

To commission the device, you must set the following parameters. For more detailed information about the parameters, refer to the respective sections.

7.2.1 Setting the language

You can use this parameter to set the display language for the device. The following languages are available:

English	Italian
German	Portuguese
French	Russian
Spanish	

To set the language, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General.
⇒ Language
2. Press **F1** or **F5** to select the required language.
3. Press **←**.
⇒ The language is set.

7.2.2 Setting further parameters

Set further parameters to commission the device. You will find more detailed information about the respective parameters in the "Operation" [► Section 8, Page 49] chapter.

Setting transformer data

Set the transformer data and phase difference of the current transformer and voltage transformer:

1. Set primary transformer voltage [► Section 8.7.1, Page 82].
2. Set secondary transformer voltage [► Section 8.7.2, Page 82].
3. Set primary transformer current [► Section 8.7.3, Page 83].
4. Select current-transformer connection [► Section 8.7.4, Page 84].
5. Select transformer circuit [► Section 8.7.5, Page 84].

Setting NORMset

If you want to commission voltage regulation quickly, you can activate NORMset mode. If you want to set the parameters yourself, continue with the sections below.

- Activate NORMset and set the relevant parameters [► Section 8.3, Page 59].

Setting control parameters

Set the following control parameters:

1. Set desired value 1 [► Section 8.4.1, Page 63].

2. Set the bandwidth [► Section 8.4.3.2, Page 66].
3. Set delay time T1 [► Section 8.4.4, Page 66].

Setting line drop compensation (optional)

If you need line drop compensation, you must set all important parameters for this:

1. Select the LDC compensation method [► Section 8.6.1, Page 76].
2. Set the line data for the ohmic voltage drop U_r [► Section 8.6.1.1, Page 78].
3. Set the line data for the inductive voltage drop U_x [► Section 8.6.1.2, Page 79].

7.3 Function tests

Before switching from manual mode to auto mode, Maschinenfabrik Reinhausen recommends carrying out function tests. These function tests are described in the following sections. Note the following points for all function tests:

- You must ensure that REMOTE mode is disabled before you can control the on-load tap-changer manually in manual mode.
- You can only activate the on-load tap-changer manually in manual mode using the  and  keys.
- During the function test, you must set the most important parameters. Details on the parameters listed can be found in the Operation [► Section 8, Page 49] chapter.

7.3.1 Checking control functions

This section describes how you can check the device's control functions:

✓ Supply voltage must be present.

1. Press  to select manual mode.
2. Set transmission ratio for voltage transformer, current transformer and measuring set-up.
3. Measure actual voltage and compare with the measured value displayed on the device's main screen.
4. Press  key several times to display the operating values for current, power and phase angle and compare them with values of service instruments.
5. Control the on-load tap-changer manually with the  or  keys until the measured voltage (U_{actual}) reaches the desired voltage (U_{desired}) set in the next stage.
6. Set desired value 1 to the value you want.

7. Set bandwidth depending on step voltage [► Section 8.4.3, Page 65].
8. Set delay time T1 to 20 seconds [► Section 8.4.4, Page 66].
9. Set control response T1 to linear [► Section 8.4.5, Page 67].
10. Press  to raise the on-load tap-changer 1 step.
11. Press  to select auto mode.
⇒ After 20 seconds, the device returns the on-load tap-changer to the original operating position.
12. Press  to select manual mode.
13. Press  to lower the on-load tap-changer 1 step.
14. Press  to select auto mode.
⇒ After 20 seconds, the device returns the on-load tap-changer to the original operating position.
15. Press  to select manual mode.
16. Set delay time T2 to 10 seconds [► Section , Page 68].
17. Activate delay time T2.
18. Press  twice to raise the on-load tap-changer 2 steps.
19. Press  to select auto mode.
⇒ After 20 seconds, the device lowers the on-load tap-changer one step and after another 10 seconds another step.
20. Press  to select manual mode.
21. Set delay time T1 [► Section 8.4.4, Page 66] and delay time T2 [► Section , Page 68] to the desired value.

We recommend a temporary setting of 100 seconds for **delay time T1** when commissioning the transformer. Depending on the operating conditions, you can also specify the delay time following a longer observation period. In this regard, it is useful to register how the actual voltage progresses and the number of tap-change operations per day.

7.3.2 Checking additional functions

This section describes how you can check the following additional functions:

- Undervoltage blocking
- Overvoltage blocking
- Activation of desired values 2 and 3
- Line drop compensation
- Z compensation

Proceed as follows:

Checking undervoltage blocking U<

1. Press  to select manual mode.
2. Set undervoltage U < [%] to 85 %.
3. Set the U< blocking parameter to On [► Section , Page 71].
4. Set desired value 1 such that the measured voltage U_{actual} is below the undervoltage U< [%] limit value.

Measured voltage = 100 V

Desired value 1 = Set to 120 V (greater than $100 \text{ V} / 0.85 = 117 \text{ V}$).

- ⇒ The *Undervoltage U<* LED will light up.
- ⇒ After around 10 seconds the *Undervoltage* message appears in the display and the relevant signaling relay is activated. Contact X4:1/3 closes and contact X4:2/3 opens.
- 5. Press  to select auto mode.
- ⇒ The device blocks and does not issue any control commands.
- 6. Press  to select manual mode.
- 7. Reset the operating values for **desired value 1** and **undervoltage U< [%]** to the desired operating values.
- ⇒ The function test for undervoltage blocking is complete.

Checking overvoltage blocking U>

1. Press  to select manual mode.
2. Set overvoltage U> [%] to 115 %.
3. Set the absolute limit values parameter to Off.
4. Set desired value 1 such that the measured voltage U_{actual} is above the overvoltage U> [%] limit value.

Measured voltage = 100 V

Desired value 1 = Set to 85 V (less than $100 \text{ V} / 1.15 = 87 \text{ V}$).

- ⇒ The *Overvoltage U>* LED will light up.
- ⇒ The *Overvoltage* message appears in the display and the relevant signaling relay is activated. Contact X4:1/3 closes and contact X4:2/3 opens.
- 5. Press  to select auto mode.
- ⇒ The LOWER output relay emits a control command every 1.5 seconds.
- 6. Press  to select manual mode.
- 7. Reset the operating values for **desired value 1** and **overvoltage U> [%]** to the desired operating values.
- ⇒ The function test for overvoltage blocking is complete.

Checking desired value 2 and desired value 3

1. Press to select manual mode.
 2. Set **desired value 2** to the value you want.
 3. Apply voltage *L+* to terminal *X4:17 desired value 2* (see connection diagram).
 4. Press until the main screen is displayed.
⇒ **Desired value 2** is shown on the main screen.
 5. Set desired value 3 to the value you want.
 6. Apply voltage *L+* to terminal *desired value 3* (see connection diagram).
 7. Press until the main screen is displayed.
⇒ **Desired value 3** is shown on the main screen.
- ⇒ The function test for **desired value 2** and **desired value 3** is complete.

Checking line drop compensation

If you want to use line drop compensation, you need to run this function test. A load current of $\geq 10\%$ of the nominal transformer current is needed for the following function tests. Before the function test, ensure that all parameters for line drop compensation and for Z compensation are set to **0**.

1. Press to select manual mode.
2. Set the compensation method parameter to LDC.
3. Press until the main screen is displayed.
4. If necessary, press until the control deviation **dU** is shown.
⇒ The measured voltage must be within the bandwidth.
5. Set line drop compensation *Ur* parameter to 20.0 V.
6. Press until the main screen is displayed.
7. If necessary, press until the control deviation **dU** is shown.
⇒ The value for control deviation *dU* must be negative.
8. Set line drop compensation *Ur* parameter to -20.0 V.
9. Press until the main screen is displayed.
10. If necessary, press until the control deviation **dU** is shown.
⇒ The value for control deviation **dU** must be positive.

If the control deviation appears in the opposite direction, change the polarity of the current transformer.

11. Set the **line drop compensation Ur** and **line drop compensation Ux** parameters to the desired operating values.

⇒ The function test for line drop compensation is complete.

Checking Z compensation

If you want to use Z compensation, you need to run this function test. A load current of $\geq 10\%$ of the nominal transformer current is needed for the following function test.

1. Press  to select manual mode.
2. Set all parameters for line drop compensation and Z compensation to 0.
3. Set the compensation method parameter to Z.
4. Press  until the main screen is displayed.
5. If necessary, press  until the control deviation **dU** is shown.

⇒ The measured voltage must be within the bandwidth.
6. Set the Z compensation parameter to 15.0 V.
7. Press  until the main screen is displayed.
8. If necessary, press  until the control deviation **dU** is shown.

⇒ The control deviation dU must be negative.

If the control deviation appears in the opposite direction, change the polarity of the current transformer.

9. Set the **Z compensation** and **Z compensation limit value** parameters to the desired operating values.

⇒ The function test for Z compensation is complete.

8 Operation

This chapter describes all the functions and setting options for the device.

8.1 Key lock

The device is equipped with a key lock to prevent unintentional operation. You can only set or change the parameters when the key lock is deactivated in manual mode.

Activating key lock

To activate the key lock, proceed as follows:

► Press **ESC** and **F5** at the same time.

⇒ A confirmation appears in the display for a brief period. The key lock is activated. Parameters can no longer be entered.

Deactivating key lock

To deactivate the key lock, proceed as follows:

► Press **ESC** and **F5** at the same time.

⇒ The key lock is deactivated. Parameters can be entered.

8.2 General

You can undertake general settings on the device in the **General** menu item.

- Language [► Section 7.2.1, Page 43]
- Regulator ID
- Baud rate (COM1 setting)
- Raise/Lower pulse duration
- Operations counter
- Display dimming
- Key lock
- Function monitoring
- Motor runtime
- Manual mode/auto mode
- Local/Remote

8.2.1 Setting device ID

You can use the device ID parameter to assign a 4-digit ID to the device. This ID is used to uniquely identify the device in the TAPCON®-trol software.

To set the device ID, proceed as follows:

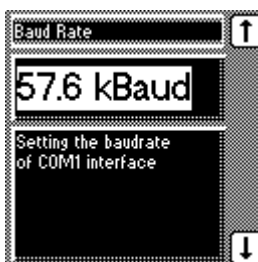

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Regulator ID.
 2. Press **F1** to change the first digit.
⇒ If you wish to enter a multi-digit sequence, proceed to step 3. If you do not wish to enter additional digits, proceed to step 7.
 3. Press **F1** (digit > 9) until another digit position appears.
 4. If necessary, press **F4** in order to highlight the digit position.
⇒ The required digit is highlighted and can be changed.
 5. Press **F1** or **F5** to change the digit.
 6. Repeat steps 3 to 5 until all required digits have been entered.
 7. Press **←**.
- ⇒ The device ID is set.

8.2.2 Setting the baud rate

You can use this parameter to set the COM1 interface's baud rate. You can select the following options:

- 9.6 kilobaud
- 19.2 kilobaud
- 38.4 kilobaud
- 57.6 kilobaud

To set the baud rate, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Baud rate.
 2. Press **F1** or **F5** to select the required baud rate.
 3. Press **←**.
- ⇒ The baud rate is set.

8.2.3 Setting the switching pulse time

You can use this parameter to set the duration of the switching pulse for the motor-drive unit.

If you set the switching pulse time to 0 s, the motor-drive unit is activated with a continuous signal. The signal then remains active for as long as the **↑** or **↓** keys are pressed.

Switching pulse in normal mode

If you set the switching pulse time to 1.5 seconds for example, after the set **delay time T1** or **delay time T2** **1** there will be a switching pulse of 1.5 seconds **2**.

The waiting time between 2 consecutive switching pulses corresponds to the set **delay time T1** or **delay time T2** **1**.

Figure 32: Switching pulse time in normal mode

1 Set delay time T1 or T2

2 Set switching pulse time (for example 1.5 seconds)

If the motor-drive unit does not start with the factory setting (1.5 seconds), you need to extend the raise switching pulse time / lower switching pulse time.

Switching pulse for rapid return control

If you set the raise switching pulse time or lower switching pulse time to 1.5 seconds, for example **2**, the next earliest switching pulse occurs in rapid return control mode **3** 1.5 seconds after the previous switching pulse ended.

Figure 33: Switching pulse in rapid return control mode

- | | |
|--|---|
| <p>1 Start of first raise switching pulse/
lower switching pulse</p> <p>2 Set switching pulse time (for exam-
ple 1.5 seconds)</p> | <p>3 Earliest time for the next raise
switching pulse/lower switching
pulse (for example 1.5 seconds)</p> |
|--|---|

To set the pulse duration, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **...** until the desired parameter is displayed.
⇒ R/L pulse duration.
 2. Press **F1** or **F5** to select the pulse duration you want.
 3. Press **←**.
- ⇒ The R/L pulse duration is now set.

8.2.4 Setting operations counter

The device's operations counter is automatically increased with every tap-change operation. You can use this parameter to set the number of tap-change operations for comparing with the operations counter of the motor-drive unit, for example.

To ensure correct operation counter function, the *Motor running* signal of the motor-drive unit must be connected with a configurable input (GPI 1...6) and then the **Motor running** function assigned to this input.

To set the operations counter, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Operations counter.
2. Press **F4** to highlight a digit.
⇒ The desired position is highlighted and the value can be changed.
3. Press **F1** to increase the value or **F5** to reduce it.
4. Press **↵**.
⇒ The operations counter is set.

8.2.5 Dimming display

You can use this parameter to activate or deactivate automatic display dimming. You can select the following options:

- On: The display is automatically dimmed if no key is pressed for 15 minutes. The display returns to full brightness by pressing any key.
- Off: Automatic display dimming is deactivated.

Activating this function extends the display's service life.

To activate/deactivate automatic display dimming, proceed as follows:

1. Press **MENU** > **F4** Configuration > **F3** General > **→** until the desired parameter is displayed.
⇒ Display off.
2. Press **F1** or **F5** to activate/deactivate automatic dimming.
3. Press **↵**.
⇒ Automatic dimming is set.

8.2.6 Activating/deactivating the automatic key lock

Activating this function automatically activates the key lock if no keys are pressed for 15 minutes. You can also lock the keys manually. This function can be deactivated as well.

To set the automatic key lock, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Key lock
2. Press **F1** or **F5** to select **On** or **Off**.
3. Press **↵**.
⇒ Automatic key lock is set.

8.2.7 "Function monitoring" message for monitoring messages <30 V

By default, the *Function monitoring* message is activated for measured voltages. This message is issued as soon as the measured voltage is under 30 V for longer than the set signaling delay time.

Switched-off transformer

You can suppress the message with this parameter to prevent the message from being continuously issued when a transformer is shut off.

The device behaves as follows:

Parameter	Function
On	The <i>Function monitoring</i> message is issued after the configured delay time if the measured voltage is less than 30 V.
Off	The <i>Function monitoring</i> message is suppressed if the measured voltage is less than 30 V.

Table 8: Settings

Activate/deactivate message

To activate/deactivate *function monitoring*, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Function monitoring
2. Press **F1** or **F5** to select **On** or **Off**.
3. Press **↵**.
⇒ The *Function monitoring* message for is activated/deactivated for measured voltages <30 V.

Setting delay time

You can configure the delay time after which the *Function monitoring* message is to be issued. If you select **0**, function monitoring is deactivated.

To set the delay time for the *Function monitoring* message, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Delay function monitoring
 2. Press **F1** to increase the value or **F5** to reduce it.
 3. Press **←**.
- ⇒ The delay time for the *Function monitoring* message is set.

8.2.8 Setting motor runtime monitoring

You can use this motor runtime parameter to set the motor runtime. The motor-drive unit's runtime can also be monitored by the device. This function is used to identify motor-drive unit malfunctions during the tap-change operation and to trigger any actions needed.

Behavior The motor-drive unit issues the *Motor-drive unit running* signal during the tap-change operation. This signal is present until the tap-change operation is complete. The device compares the duration of this signal with the set motor runtime. If the set motor runtime is exceeded, the device triggers the following actions:

1. *Motor runtime monitoring* message is issued
2. Continuous signal via output relay *Motor-drive unit runtime exceeded* (optional)
3. Pulse signal via *Trigger motor protective switch* output relay (optional)

Parameterizing control input To use runtime monitoring, you need to correctly wire the corresponding control input and parameterize to *Motor running*. The motor runtime must also be set.

Wiring control input/output relay

If you want to monitor the motor runtime, the device and motor-drive unit must be connected and parameterized as shown below.

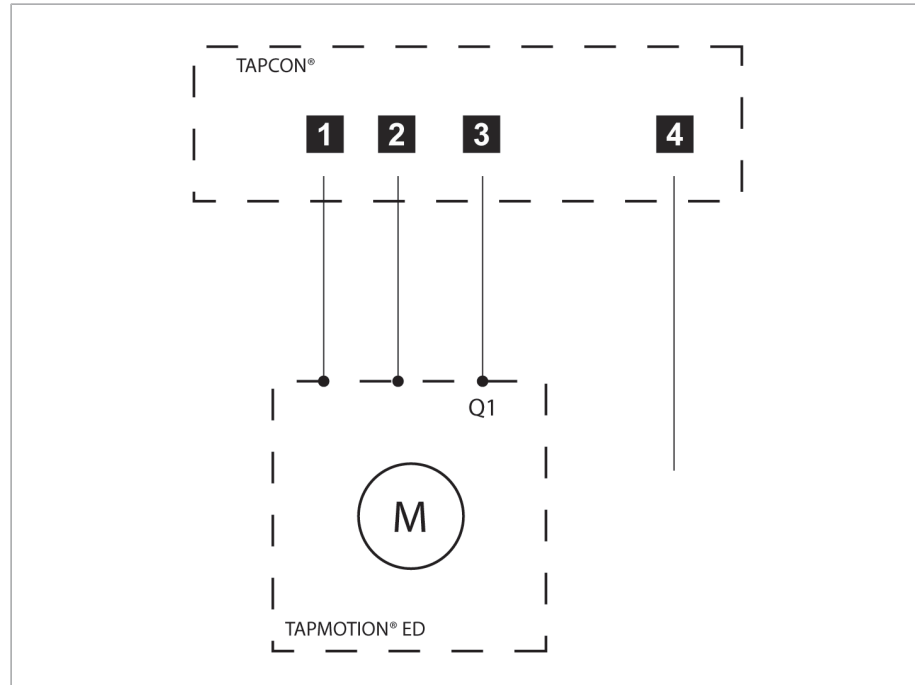

Figure 35: Wiring for motor runtime monitoring

1 <i>Motor running</i> control input I/O	3 <i>Motor protective switch tripped</i> GPO output relay (optional)
2 <i>Motor protective switch triggered</i> control input I/O (optional)	4 <i>Motor runtime exceeded</i> GPO output relay (optional)

If you want to use the output relay, the feedback from the motor-drive unit *Motor protective switch triggered* must be wired to a control input and parameterized. This message resets the *Motor runtime exceeded* output relay when the motor protective switch is switched back on and activates the *Motor protective switch triggered* message.

If the runtime monitoring is set to "0.0 s", this equates to it being switched off.

To set the motor runtime, proceed as follows:

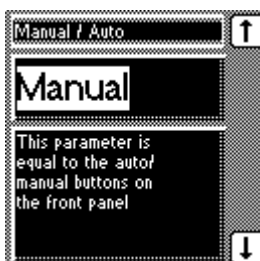

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Motor runtime.
2. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
3. Press **F1** to increase the value or **F5** to reduce it.
4. Press **↵**.
⇒ The motor runtime is set.

8.2.9 Activate manual mode/auto mode

This parameter can be used to activate the *Manual* or *Automatic* operation modes. This parameter has the same functions as the **MANUAL** and **AUTO** keys.

Parameter	Function
Manual	Device is no longer controlling automatically. You can set or change parameters manually. You can control the motor-drive unit using the control panel.
Auto	The device is controlling the voltage automatically. You cannot set or change any parameters. You cannot control the motor-drive unit using the control panel.

Table 9: Adjustable parameters

To select the operating mode, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Manual/Automatic
2. Press **F1** or **F5** to select the operating mode you want.
3. Press **↵**.
⇒ The operating mode is set.

8.2.10 Activating Local/Remote

This parameter can be used to activate the *Local* or *Remote* operation modes. This parameter has the same functions as the  keys.

Parameter	Function
Local	You can operate the device using the control panel.
Remote	You can operate the device using an external control level.
	Manual operation is disabled.

Table 10: Adjustable parameters

To activate Manual or Automatic operating mode, proceed as follows:

1.  >  Configuration >  General > Press  until the desired parameter is displayed.
2. Local/Remote
3. Press  or  to select the operating mode you want.
4. Press .

⇒ The operating mode is set.

8.2.11 Setting the COM1 password

You can use this parameter to enter a password for the COM1 front interface. This enables you to protect the device against unauthorized access via these interfaces. If a COM1 password is assigned, you must first enter the correct password to establish a connection via the interfaces.

Note the following information:

- The password must be at least 1 character long and must not exceed 8 characters. If you enter an empty password (only an end marker), then the COM1 password is deactivated.
- You can enter alphanumeric characters (A to Z, a to z, 0 to 9) and an end marker (space).
- If you want to use a password with fewer than 8 characters, you must select the end marker after the last character of your password.
- Once you save the password, the display changes to xxxxxxxx. The password is only displayed in plain text during text input.

Proceed as follows to set the COM1 password:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ COM1 password.
2. Enter the current COM1 password. Press **F1** or **F5** to change a character and **F4** to select the next character.
3. Press **↵**.
⇒ The *Parallel operation active* LED flashes. You can establish a connection via the front interface or enter a new password.
4. Press **F1** or **F5** to change a character and **F4** to select the next character.
5. Press **↵**.
⇒ The COM1 password is set. The display changes to `XXXXXXXX`.

8.2.12 Setting the password duration

You can use this parameter to set the period for which the password is active once it has been entered. If the password is active, the *Parallel operation active* LED flashes.

If you establish a connection via the COM1 front interface, the password remains active for as long as data is being transferred via the interface. The set password duration expires the moment that no more data is transmitted.

To set the password duration, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** General > Press **→** until the desired parameter is displayed.
⇒ Password duration.
2. Press **F1** or **F5** to increase or decrease the value.
3. Press **↵**.
⇒ The password duration is set.

8.3 NORMset

NORMset mode is used for quickly starting voltage regulation. In NORMset mode, the bandwidth and delay time parameters are automatically adapted to the requirements of the grid.

To start NORMset mode, you must set the following parameters:

- Normset activation
- Desired value 1

- Primary voltage
- Secondary voltage

Line drop compensation cannot be performed in NORMset mode.

Set the following parameters to operate the device in NORMset mode.

Activating/deactivating NORMset

You can use this parameter to activate NORMset mode.

A manual tap-change operation is required to activate NORMset. This is how the voltage regulator determines the bandwidth required.

If the transformer is switched off, another manual tap-change operation is required.

To activate/deactivate NORMset mode, proceed as follows:

1. **MENU** > **F2** NORMset
⇒ NORMset activation.
2. Press **F1** or **F5** to activate NORMset by selecting **On** or to deactivate NORMset by selecting **Off**.
3. Press **↵**.
⇒ NORMset is activated/deactivated.

Setting the primary voltage

With this parameter, you can set the voltage transformer's primary voltage.

To set the primary voltage, proceed as follows:

1. **MENU** > **F2** NORMset > Press **→** until the desired parameter is displayed.
⇒ Primary voltage.
2. Press **F1** to increase the value or **F5** to reduce it.
3. Press **↵**.
⇒ The primary voltage is set.

Setting the secondary voltage

With this parameter, you can set the voltage transformer's secondary voltage.

To set the secondary voltage, proceed as follows:

1. **MENU** > **F2** NORMset > Press **→** until the desired parameter is displayed.
⇒ Secondary voltage.
 2. Press **F1** to increase the value or **F5** to reduce it.
 3. Press **←**.
- ⇒ The secondary voltage is set.

Setting desired value 1

With this parameter, you can set the desired value for automatic voltage regulation. You can enter the desired value in V or in kV. If you enter the desired value in V, the value relates to the voltage transformer's secondary voltage. If you set the desired value in kV, the value relates to the voltage transformer's primary voltage.

Settings in kV are only possible if you have previously entered the parameters for primary and secondary voltage.

To set the desired value, proceed as follows:

1. **MENU** > **F2** NORMset > Press **→** until the desired parameter is displayed.
⇒ Desired value 1.
 2. Press **F1** to increase the value or **F5** to reduce it.
 3. Press **←**.
- ⇒ The desired value is set.

8.4 Control parameters

All of the required for the regulation function are described in this section. For voltage regulation, you can set the following parameters:

- Desired values 1...3
- Bandwidth
- Delay time T1
- Control response T1
- Delay time T2

For voltage regulation, you can set delay time T1 and also delay time T2. The following sections describe how the regulation function responds in both cases:

Behavior only with delay time T1

If the measured voltage U_{actual} **5** is within the set bandwidth **6**, no control commands are issued to the motor-drive unit for the tap-change operation. Control commands will also not be issued to the motor-drive unit if the measured voltage returns to the tolerance bandwidth **6** within the set delay time T1 **4**. However, if the measured voltage deviates from the set bandwidth for a long period **C**, a tap-change command **D** occurs after expiration of the set delay time T1. The on-load tap-changer carries out a tap-change in a raise or lower direction to return to the tolerance bandwidth.

Figure 38: Behavior of the regulation function with delay time T1

1 + B %: Upper limit	4 Set delay time T1
2 U_{desired} : Desired value	5 U_{actual} : Measured voltage
3 - B %: Lower limit	6 B%: Tolerance bandwidth
A U_{actual} is outside the bandwidth. Delay time T1 starts.	B U_{actual} is within the bandwidth before delay time T1 is complete.
C U_{actual} is outside the bandwidth. Delay time T1 starts.	D U_{actual} is still outside the bandwidth when delay time T1 is complete. Tap-change operation is initiated.

Behavior with delay times T1 and T2

Delay time T2 can be used to correct major control deviations more quickly. Ensure that you set a lower value in the "Delay time T2" parameter than in the "Delay time T1" parameter.

If the measured voltage U_{actual} **5** deviates from the set bandwidth for a long period **A**, a control impulse is output to the motor-drive unit after the set delay time T1 **B**. If the measured voltage U_{actual} is still outside the bandwidth,

delay time T2 **B** starts once delay time T1 is complete. Once delay time T2 is complete, a control impulse is again output to the motor-drive unit for the tap change **C** to return to the tolerance bandwidth.

Figure 39: Behavior of the regulation function with delay times T1 and T2

1 + B %: Upper limit	4 Set delay times T1 and T2.
2 U_{desired} : Desired value	5 U_{actual} : Measured voltage
3 - B %: Lower limit	6 B%: Tolerance bandwidth
A U_{actual} is outside the bandwidth. Delay time T1 starts.	B Delay time T1 complete. Tap change triggered.
C Delay time T2 complete. Tap change triggered.	

The following sections describe how to set the relevant control parameters.

8.4.1 Setting desired value 1...3

You can use this parameter to set up to 3 desired voltage values U_{Ref} . The desired voltage value is specified as a fixed value. The desired value 1 is the default desired value. Desired values 2 and 3 are activated if there is a continuous signal at factory-preset control inputs X4:17 or X4:18 provided you have programmed these previously. If there is a signal at several control inputs at the same time, desired value 2 is activated.

Options for setting the desired values

The device provides the following ways of changing the desired voltage value during operation:

- Using the control parameters menu item via the operating screen
- Using binary inputs
- Using control system protocols if a communication card is ready for operation

Reference of kV and V for voltage transformer

Desired values set in kV refer to the primary voltage of the voltage transformer. Desired values set in V refer to the secondary voltage of the voltage transformer. The transformer data must be entered correctly for this display.

To set the desired value, proceed as follows:

1. **MENU** > **F3** Control parameter > **F2** voltage regulator > Press **→** until the desired parameter is displayed.
2. If you have already entered the transformer data, press **F3** to select the unit you want: "V" or "kV".
3. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
4. Press **F1** to increase the value or **F5** to reduce it.
5. Press **↵**.
⇒ The desired value is set.

8.4.2 Selecting a desired value

You can use this parameter to select the active desired value 1, 2 or 3.

If you select the desired value using appropriately configured GPIs, this parameter's setting is ignored. Refer to the Configuration [► Section 8.8, Page 88] section for more information about GPI configuration.

Proceed as follows to select a desired value:

1. **MENU** > **F3** Control parameter > **F2** Voltage regulation > Press **→** until the desired parameter is displayed.
⇒ Desired value selection
2. Press **F1** or **F5** to select an active desired value.
3. Press **↵**.
⇒ The selected desired value is active.

8.4.3 Bandwidth

You can use this parameter to set the maximum permissible deviation in measured voltage U_{Act} . The deviation relates to the activated desired value. The following sections describe how you determine and set the bandwidth required.

8.4.3.1 Determining bandwidth

In order to set the correct value, the transformer's step voltage and nominal voltage must be known.

Too small/large a bandwidth

You have to set the bandwidth in such a way that the output voltage of the transformer (U_{Act}) returns to within the specified tolerance bandwidth after the tap change. If too small a bandwidth is defined, the output voltage exceeds the bandwidth selected and the device immediately issues a tap-change command in the opposite direction. If a very large bandwidth is selected, this results in a major control deviation.

The following value is recommended for the bandwidth setting:

$$[\pm B\%] \geq 0,6 \cdot \frac{U_{n-1} - U_n}{U_{nom}} \cdot 100\%$$

Figure 41: Recommended bandwidth

U_{n-1}	Step voltage of tap position n-1
U_n	Step voltage of tap position n
U_{nom}	Nominal voltage

The following transformer values are used to determine the recommended bandwidth:

Nominal voltage $U_{nom} = 11,000 \text{ V}$

Step voltage in tap position 4 $U_{Step4} = 11,275 \text{ V}$

Step voltage in tap position 5 $U_{Step5} = 11,000 \text{ V}$

$$[\pm B\%] \geq 0,6 \cdot \frac{U_{Step4} - U_{Step5}}{U_{nom}} \cdot 100\%$$

$$[\pm B\%] \geq 0,6 \cdot \frac{11275 \text{ V} - 11000 \text{ V}}{11000 \text{ V}} \cdot 100\%$$

$$[\pm B\%] \geq 1,5\%$$

The following section describes how you can set the bandwidth.

8.4.3.2 Setting the bandwidth

To enter the determined bandwidth, proceed as follows:

1. **MENU** > **F3** Parameter > **F2** Control parameter > Press **→** until the desired parameter is displayed.
2. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
3. Press **F1** to increase the value or **F5** to reduce it.
4. Press **↵**.
⇒ The bandwidth is set.

8.4.3.3 Visual display

The deviation from the set bandwidth is shown visually in the device's display. The measured voltage **3** highlighting shows whether the measured voltage is above, within or below the set bandwidth **1**. Progress of delay time T1 is indicated by the gradual filling of the time bar **2**. The seconds display **5** above this indicates the remaining delay time T1.

Figure 42: Visual display of deviation from desired value

1 Bandwidth (upper and lower limit)	4 Desired voltage value U_{desired}
2 Time bar for delay time T1	5 Remaining delay time T1
3 Measured voltage U_{actual}	

8.4.4 Setting delay time T1

Use this parameter to set delay time T1. This function delays the issuing of a tap-change command for a defined period. This prevents unnecessary tap-change operations if the tolerance bandwidth is exited.

To set the delay time T1, proceed as follows:

1. **MENU** > **F3** Parameter > **F2** Control parameter > Press **→** until the desired parameter is displayed.
2. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
3. Press **F1** to increase the time or **F5** to reduce it.
4. Press **←**.
⇒ The delay time T1 is set.

8.4.5 Setting control response T1

The control response T1 can be set to linear or integral.

Linear control response T1 With linear control response, the device responds with a constant delay time regardless of the control deviation.

Integral control response T1 With integral control response, the device responds with a variable delay time depending on the control deviation. The greater the control deviation (ΔU) in relation to the set bandwidth (B), the shorter the delay time. The delay time can therefore be reduced down to 1 second. This means that the device responds faster to large voltage changes in the grid. Regulation accuracy improves as a result but the frequency of tap-changes increases too.

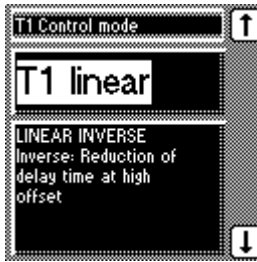

Figure 43: Diagram showing integral control response

$\Delta U/B$ Control deviation " ΔU " as % of desired value as ratio to the set bandwidth "B" as % of desired value

1 "Delay time T1" parameter

To set the control response T1, proceed as follows:

1. **MENU** > **F3** Parameter > **F2** Control parameter > Press **→** until the desired parameter is displayed.
2. Press **F1** or **F5** to set the response you want.
3. Press **↵**.

⇒ The control response T1 is set.

8.4.6 Setting delay time T2

With this parameter, you can set delay time T2. Delay time T2 is used to compensate for large control deviations faster.

The delay time T2 only takes effect if more than one tap-change operation is required to return the voltage to within the set bandwidth. The first output pulse occurs after the set delay time T1. After the set tap-change delay time T2 has elapsed, additional pulses occur in order to correct the existing control deviation.

The following requirements must be noted to set delay time T2:

- The delay time T2 must be greater than the switching pulse time.
- The delay time T2 must be greater than the maximum operating time of the motor-drive unit.
- The delay time T2 must be less than the value set for delay time T1.

To set the delay time T2, proceed as follows:

1. **MENU** > **F3** Parameter > **F2** Control parameter > Press until the desired parameter is displayed.
⇒ Delay time T2.

2. Press **F1** to increase the time or **F5** to reduce it.
3. Press **↵**.

⇒ The delay time T2 is set.

Activating/deactivating delay time T2

To activate/deactivate delay time T2, proceed as follows:

1. **MENU** > **F3** Parameter > **F2** Control parameter > Press **→** until the desired parameter is displayed.
⇒ T2 activation.

2. Press **F5** or **F1** to activate/deactivate T2.
3. Press **↵**.

⇒ The delay time T2 is activated/deactivated.

8.5 Limit values

In the Limit values menu item, you can set all the parameters needed for limit value monitoring as relative or absolute values. You can set three limit values:

- Undervoltage $U<$
- Overvoltage $U>$
- Overcurrent $I>$

Limit value monitoring is used to reduce damage to the system periphery. The following sections describe how you can set the parameters.

8.5.1 Setting undervoltage monitoring $U<$

You can use these parameters to set the limit values for an undervoltage. Undervoltage monitoring prevents tap-change operations if there is a power cut.

Behavior If the measured voltage U_{actual} **7** falls below the set limit value **4**, the red LED $U<$ lights up. The switching pulses to the motor-drive unit are blocked at the same time provided you have activated the blocking undervoltage $U<$ parameter. Once the set signaling delay time [► Section , Page 71] **6** has passed, the signaling relay activates. The *Undervoltage* $U<$ **B** message appears in the display. The message is reset as soon as the measured voltage U_{actual} again exceeds the limit value for undervoltage **E**. If the measured voltage U_{actual} falls below 30 V **C** (for example when the transformer is switched off), the *undervoltage* message is also displayed. You can however suppress [► Section , Page 72] this message.

Figure 44: Response to value falling below limit value

1 + B%: Upper limit	7 U_{actual} : Measured voltage
2 U_{desired} : Desired value	A Value falls below limit value
3 - B%: Lower limit	B <i>Undervoltage</i> $U<$ message is displayed
4 Set limit value for undervoltage $U<$	C Voltage falls below 30 V
5 Limit value for suppressing alarms below 30 V	D Voltage exceeds 30 V again
6 Set signaling delay time for limit value for undervoltage $U<$	E Value exceeds limit value

Setting undervoltage monitoring $U<$ in %

Use the parameter to set the limit value as a relative value.

To set the limit value for undervoltage U< as %, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ U< Undervoltage (%)
 2. Press **F1** to increase the value or **F5** to reduce it.
 3. Press **↵**.
- ⇒ The limit value for undervoltage U< is set.

Setting signaling delay for undervoltage U<

You can use this parameter to set the delay time after which the *Undervoltage* relay is to activate and the event message appear on the display. This can be used to prevent messages from being issued when the value briefly falls below the limit value. The undervoltage LED always lights up immediately regardless.

To set the delay time for this message, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ U< Delay
 2. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
 3. Press **F1** to increase the time or **F5** to reduce it.
 4. Press **↵**.
- ⇒ The signaling delay time for undervoltage U< is set.

Activating/deactivating undervoltage blocking

You can use this parameter to set how the device behaves if the voltage falls below the undervoltage limit. You can select the following options:

Setting	Function
On	Automatic regulation is blocked.
Off	Automatic regulation remains active.

Table 11: Behavior

To activate/deactivate the undervoltage blocking, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ U< blocking.
 2. Press **F1** for **On** setting or **F5** for **Off** setting.
 3. Press **↵**.
- ⇒ Undervoltage blocking is activated/deactivated.

Activating/deactivating message for voltages below 30 V

You can use this parameter to set whether the *Undervoltage* message is to be suppressed at a measured value of less than 30 V. This setting is used to ensure that no event message appears when the transformer is switched off. You can select the following options:

Setting	Function
On	The <i>Undervoltage</i> message is also displayed when the measured value is less than 30 V.
Off	The <i>Undervoltage</i> message is no longer displayed when the measured value is less than 30 V.

Table 12: Response

To activate/deactivate the message, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ U< also under 30 V.
 2. Press **F1** for **On** setting or **F5** for **Off** setting.
 3. Press **↵**.
- ⇒ The message is activated/deactivated.

8.5.2 Setting overvoltage monitoring U>

You can use these parameters to set the limit values for overvoltage monitoring. This overvoltage monitoring triggers tap-change operations to return to the desired operating status. If the operating status can no longer be corrected, a message is triggered by the *Function monitoring* relay.

Response to high-speed return

If the measured voltage U_{actual} exceeds the set limit value **1**, the red LED $U>$ and associated signaling relay activate. The *Overvoltage $U>$* message appears in the display. At the same time, the high-speed return function is activated without delay time T_1 . Once the set switching pulse time **5** has passed, the tap position is lowered **C** by activating the motor-drive unit until the measured voltage U_{actual} **6** again falls below the limit value **B**. The *Overvoltage $U>$* message is reset.

Figure 45: Response to limit value being exceeded

1 Set limit value for overvoltage $U>$	6 U_{actual} : Measured voltage
2 + B %: Upper limit	A Value exceeds limit value
3 U_{desired} : Desired value	B Value falls below limit value
4 - B %: Lower limit	C High-speed return is started (lower tap-change)
5 Set switching pulse time	

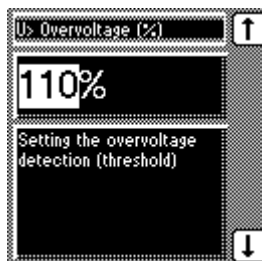

Response to overvoltage blocking

If you activated the overvoltage blocking, all switching pulses to the motor-drive unit are blocked when a limit value is exceeded. At the same time, the red LED $U>$ lights up and the *Overvoltage $U>$* message is displayed. As soon as the measured voltage U_{actual} has again fallen below the limit value, blocking and the message are reset.

The following sections describe how you can set the parameters for the overvoltage $U>$ limit value.

Setting overvoltage U> as %

The limit value is entered as a relative value (%) of the set desired value. To set the limit value, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ U> Overvoltage (%)
 2. Press **F1** to increase the value or **F5** to reduce it.
 3. Press **↵**.
- ⇒ The limit value is set.

Activating overvoltage blocking/high-speed return

You can use this parameter to set how the device responds to overvoltage. The following settings are possible:

Setting	Behavior
On	During overvoltage, the device blocks all switch pulses to the motor-drive unit.
Off	In the event of overvoltage, a high-speed return is undertaken until the value again falls below the limit value.

Table 13: Possible settings

To set the device's response to overvoltage, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ Overvolt. blocking U>.
 2. Press **F1** or **F5** to set the option you want.
 3. Press **↵**.
- ⇒ The response is set.

8.5.3 Setting overcurrent monitoring I>

You can use this parameter to set the limit value for overcurrent to prevent tap-change operations in the event of excess load currents.

If the measured current exceeds the set limit value, the red LED **I>** lights up. The *Overcurrent* message appears in the display. The device's output pulses are blocked at the same time.

Setting overcurrent I> as %

To set the limit value I> overcurrent for overcurrent blocking, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ Overcurrent I>
2. Press **F1** to increase the value or **F5** to reduce it.
3. Press **↵**.
⇒ The limit value is set.

Activating/deactivating overcurrent blocking

To activate/deactivate overcurrent blocking, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ Blocking Overcurr. I>
2. Press **F1** or **F5** to activate (**ON**)/deactivate (**OFF**) overcurrent blocking.
3. Press **↵**.
⇒ The overcurrent blocking is activated/deactivated.

8.5.4 Set undercurrent monitoring I<

These parameters are used to set undercurrent monitoring. As soon as the measured current falls below the set limit value, control is blocked.

Setting undercurrent I<

To set the limit value for undercurrent monitoring, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ Undercurrent I< [%]
2. Press **F1** to increase the value or **F5** to reduce it.
3. Press **↵**.
⇒ The I< undercurrent limit value is set.

Activating/deactivating I< undercurrent blocking

To activate/deactivate undercurrent monitoring, proceed as follows:

1. **MENU** > **F3** Control parameter > **F3** Limit values > Press **→** until the desired parameter is displayed.
⇒ Blocking undercurrent I<.
2. Press **F1** or **F5** to activate (ON)/deactivate (OFF) undercurrent blocking.
3. Press **↵**.
⇒ The I< undercurrent blocking is activated/deactivated.

8.5.5 Activate/deactivate active power monitoring

This parameter can be used to set active power monitoring. If blocking is activated, the control is blocked if a negative active power flow is detected. However, this is only possible if the current transformer connection is connected and correctly set. When regulator blocking is deactivated, then the sign of the active power does not affect the regulation.

To activate/deactivate regulator blocking, proceed as follows:

1. **MENU** > **F3** control parameter > **F4** Compensation > Press **→** until the desired parameter is displayed.
⇒ Neg. active power block.
2. Press **F1** or **F5** to select the option you want.
3. Press **↵**.
⇒ Blocking the regulator with negative active power is activated/deactivated.

8.6 Compensation

You can use the "Compensation" function to compensate for the load-dependent voltage drop between the transformer and consumer. The device provides 2 methods of compensation for this purpose:

- R&X compensation (line drop compensation)
- Z compensation

8.6.1 Line drop compensation

R&X compensation (LDC) requires exact cable data. Line voltage drops can be compensated very accurately using LDC.

To set R&X compensation correctly, you need to calculate the ohmic and inductive voltage drop in V with reference to the secondary side of the voltage transformer. You also need to correctly set the transformer circuit used.

Figure 46: Equivalent circuit

Figure 47: Phasor diagram

You can calculate the ohmic and inductive voltage drop using the following formulas. This voltage drop calculation relates to the relativized voltage on the secondary side of the voltage transformer.

Formula for calculating the ohmic voltage drop:

$$U_r = I_N \cdot \frac{k_{CT}}{k_{VT}} \cdot r \cdot L \cdot K [V]$$

Formula for calculating the inductive voltage drop:

$$U_x = I_N \cdot \frac{k_{CT}}{k_{VT}} \cdot x \cdot L \cdot K [V]$$

U_r	Voltage drop in V due to ohmic line resistance
U_x	Voltage drop in V due to inductive line resistance
I_N	Nominal current (amps) of selected current-transformer connection on device: 1 A; 5 A

k_{CT}	Current transformer ratio
k_{VT}	Voltage transformer ratio
r	Ohmic resistance load in Ω/km per phase
x	Inductive resistance load in Ω/km per phase
L	Length of line in km
K	Nominal current factor

Selecting the line drop compensation

To select the line drop compensation, proceed as follows:

► **MENU** > **F3** Control parameter > **F4** Compensation method.

⇒ Compensation method.

⇒ Press **F1** or **F5** until the **LDC** option is displayed.

1. Press **←**.

2. The line drop compensation is selected.

The following sections describe how you can set the parameters for the ohmic and inductive voltage drop.

8.6.1.1 Setting the ohmic voltage drop U_r

You can use this parameter to set the ohmic voltage drop (ohmic resistance load).

If you do not want to use line drop compensation, you have to set the value 0.0 V.

To set the ohmic voltage drop U_r , proceed as follows:

✓ Select the **LDC** compensation method.

1. **MENU** > **F3** Parameter > **F4** Compensation > Press **→** until the desired parameter is displayed.

⇒ U_r line drop compensation.

2. Press **F4** to highlight the position.

⇒ The desired position is highlighted and the value can be changed.

3. Press **F1** to increase the value or **F5** to reduce it.

4. Press **←**.

⇒ The ohmic voltage drop U_r is set.

8.6.1.2 Setting the inductive voltage drop U_x

You can use this parameter to set the inductive voltage drop (inductive resistance load). The compensation effect can be rotated by 180° in the display using a plus or minus sign.

If you do not want to use line drop compensation, you have to set the value 0.0 V.

To set the inductive voltage drop U_x , proceed as follows:

✓ Select the **LDC** compensation method.

1. **MENU** > **F3** Parameter > **F4** Compensation > Press **→** until the desired parameter is displayed.

⇒ U_x line drop compensation.

2. Press **F4** to highlight the position.

⇒ The desired position is highlighted and the value can be changed.

3. Press **F1** to increase the value or **F5** to reduce it.

4. Press **←**.

⇒ The inductive voltage drop U_x is set.

8.6.2 Z compensation

To keep the voltage constant for the consumer, you can use Z compensation to activate a current-dependent increase in voltage. You can also define a limit value to avoid excess voltage on the transformer.

Figure 49: Z compensation

To use Z compensation, you need to calculate the increase in voltage (ΔU) taking the current into account. Use the following formula for this purpose:

$$\Delta U = 100 \cdot \frac{U_{Tr} - U_{Load}}{U_{Load}} \cdot \frac{I_N \cdot k_{CT}}{I}$$

ΔU	Voltage increase	I	Load current in A
U_{Tr}	Transformer voltage with current I	I_N	Nominal current of current-transformer connection in A (1 A; 5 A)
U_{Load}	Voltage on line end with current I and on-load tap-changer in same operating position	k_{CT}	Current transformer ratio

Sample calculation: $U_{Tr} = 100.1 \text{ V}$, $U_{Load} = 100.0 \text{ V}$, $I_N = 5 \text{ A}$, $k_{CT} = 200 \text{ A/5 A}$, $I = 100 \text{ A}$

Produces a voltage increase ΔU of 0.2%

The following sections describe how you can set the parameters you need for Z compensation.

Select Z compensation

To select the line drop compensation, proceed as follows:

► **MENU** > **F3** Control parameter > **F4** Compensation method.

⇒ Compensation method.

⇒ Press **F1** or **F5** until the **Z** option is displayed.

1. Press **←**.

2. The Z compensation is selected.

The following sections describe how you can set the required parameters for Z compensation.

8.6.2.1 Setting Z compensation

This parameter sets the voltage increase ΔU previously calculated.

If you do not want to use Z compensation, you have to set the value 0.0 %.

To set the current dependent voltage increase, proceed as follows:

✓ Select **Z** compensation.

1. **MENU** > **F3** Parameter > **F4** Compensation > Press **→** until the desired parameter is displayed.

⇒ Z compensation.

2. Press **F1** to increase the value or **F5** to reduce it.

3. Press **←**.

⇒ The current-dependent voltage increase is set.

8.6.2.2 Setting the Z compensation limit value

You can use this parameter to define the maximum permissible voltage increase to avoid excess voltage on the transformer.

If you do not want to use a limit value, you have to set the value 0.0 %.

To set the limit value for the current-dependent voltage increase, proceed as follows:

✓ Select **Z** compensation.

✓ Set the "Z compensation" parameter

1. **MENU** > **F3** Parameter > **F4** Compensation > Press **→** until the desired parameter is displayed.

⇒ Z comp. limit value.

2. Press **F1** to increase the value or **F5** to reduce it.

3. Press **←**.

⇒ The limit value is set.

8.7 Transformer data

The transformation ratios and measuring set-up for the voltage and current transformers used in the system can be set with the following parameters. The device uses this information to calculate the corresponding measured values on the primary side of the current transformer (and therefore the transformer) from the recorded measured values. These are then displayed.

The following parameters are available for this purpose:

- Primary voltage
- Secondary voltage
- Primary current

- Secondary current (current transformer connection)
- Transformer circuit

The measured values displayed for the device are influenced by the settings for the above parameters. Note the table below.

Parameter set				Measured value display		
Primary voltage	Secondary voltage	Primary current	Transformer connection	Voltage (main screen)	Current (main screen)	Current (info screen)
-	Yes	-	-	Secondary voltage [V]	-	Secondary current [% of connection]
Yes	Yes	-	-	Primary voltage [kV]	-	Secondary current [% of connection]
Yes	Yes	Yes	-	Primary voltage [kV]	Primary current [A]	Secondary current [% of connection]
Yes	Yes	-	Yes	Primary voltage [kV]	-	Secondary current [A]
Yes	Yes	Yes	Yes	Primary voltage [kV]	Primary current [A]	Secondary current [A]

Table 14: Influence of transformer data on measured value display

8.7.1 Setting the primary transformer voltage

This parameter can be used to set the primary transformer voltage in kV. When you are setting the primary transformer voltage, the device shows the primary voltage rather than the secondary voltage in the main screen and you can also set the control parameters in kV.

If a setting of 0 kV is chosen, no primary transformer voltage is displayed.

To set the primary transformer voltage, proceed as follows:

1. **MENU** > **F4** Configuration > **F2** Transformer data.
⇒ Primary voltage.
2. Press **F3** to highlight the decimal place.
⇒ The decimal place is defined and the value can be changed.
3. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
4. Press **F1** to increase the value or **F5** to reduce it.
5. Press **←**.
⇒ The primary transformer voltage is set.

8.7.2 Setting the secondary transformer voltage

This parameter can be used to set the secondary transformer voltage in V.

To set the secondary transformer voltage, proceed as follows:

1. **MENU** > **F4** Configuration > **F2** Transformer data > Press **→** until the desired parameter is displayed.
⇒ Secondary voltage.
2. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
3. Press **F1** to increase the value or **F5** to reduce it.
4. Press **↵**.
⇒ The secondary transformer voltage is set.

8.7.3 Setting primary transformer current

This parameter can be used to set the primary transformer current.

- When you are setting the primary transformer current, the measured value is displayed in the main screen.
- If you set a value of 0, no measured value is displayed in the main screen.

Setting parameter		Current feed		Display
Primary current	Secondary current	Power connection	Info screen Primary/secondary current	Main screen
No parameterization	Unknown	1 A	100 %	0 A
No parameterization	1 A	1 A	1 A	0 A
50 A	Unknown	1 A	100 % (of primary current)	50 A (of primary current)
50 A	1 A	1 A	1 A (of secondary current)	50 A (of primary current)

Table 15: Example of unit displayed: %/A

To set the primary transformer current, proceed as follows:

1. **MENU** > **F4** Configuration > **F2** Transformer data > Press **→** until the desired parameter is displayed.
⇒ Primary current.
2. Press **F4** to highlight the position.
⇒ The desired position is highlighted and the value can be changed.
3. Press **F1** to increase the value or **F5** to reduce it.
4. Press **↵**.
⇒ The primary transformer current is set.

8.7.4 Setting the current transformer connection

This parameter can be used to set the current transformer connection. This setting is needed for the device to display the correct secondary current in the info screen.

If you select the "Unknown" option, the percentage of current (with reference to the current transformer connection used) is displayed in the info screen.

- 1 A
- 5 A

Proceed as follows to set the current-transformer connection:

1. Press **MENU** > **F4** Configuration > **F2** Transformer data > Press **→** until the desired parameter is displayed.
⇒ Current-transformer connection
2. Press **F1** or **F5** to select a current-transformer connection.
3. Press **↵**.
⇒ The current-transformer connection is set.

8.7.5 Setting the phase difference for the current transformer/voltage transformer

You can use this parameter to set the phase difference of the current transformer and voltage transformer. You can set the common transformer circuits as follows:

Tap-change operation	Setting	Measurement method	Phase difference
A	0 1PH	1 phase	0°
B	0 3PHN	3 phase	0°
C	0 3PH	3 phase	0°
D	90 3PH	3 phase	90°
E	30 3PH	3 phase	30°
F	-30 3PH	3 phase	-30°

Table 16: Set values for transformer circuit

Note the following sample circuits to select the correct transformer circuit.

Circuit A: 1-phase measurement in 1-phase grid

Figure 52: Phase difference 0 1PH

- The voltage transformer VT is connected to the outer conductor and neutral conductor.
- The current transformer CT is looped into the outer conductor.
- The voltage U_{L1} and current I_{L1} are in phase.
- The voltage drop on an outer conductor is determined by the current I_{L1} .

Circuit B: 1-phase measurement in 3-phase grid

Figure 53: Phase difference 0 3PHN

- The voltage transformer VT is connected to the outer conductors L1 and neutral.
- The current transformer CT is looped into the outer conductor L1.
- The voltage U and current I are in phase.
- The voltage drop on an outer conductor is determined by the current I_{L1} .

Circuit C:

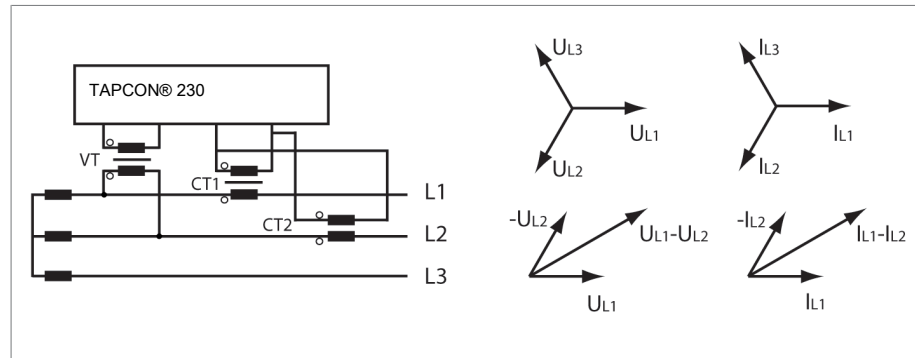

Figure 54: Phase difference 0 3PH

- The voltage transformer VT is connected to the outer conductors L1 and L2.
- The current transformer CT1 is looped into the outer conductor L1 and CT2 into the outer conductor L2.
- The current transformers CT1 and CT2 are connected crosswise in parallel (total current = $I_{L1} + I_{L2}$).
- The total current $I_{L1} + I_{L2}$ and voltage $U_{L1}-U_{L2}$ are in phase.
- The voltage drop on an outer conductor is determined by the current: $(I_{L1} + I_{L2}) / \sqrt{3}$.

Circuit D

Figure 55: Phase difference 90 3PH

- The voltage transformer VT is connected to the outer conductors L1 and L2.
- The current transformer CT is looped into the outer conductor L3.
- The current I_{L3} is ahead of voltage $U_{L1}-U_{L2}$ by 90°.
- The voltage drop on an outer conductor is determined by the current I_{L3} .

Circuit E

Figure 56: Phase difference 30 3PH

- The voltage transformer VT is connected to the outer conductors L1 and L2.
- The current transformer CT is looped into the outer conductor L2.
- The current I_{L2} is ahead of voltage $U_{L2}-U_{L1}$ by 30° .
- The voltage drop on an outer conductor is determined by the current I_{L2} .

Circuit F

Figure 57: Phase difference -30 3PH

- The voltage transformer VT is connected to the outer conductors L1 and L2.
- The current transformer CT is looped into the outer conductor L1.
- The current I_{L1} lags behind $U_{L1}-U_{L2}$ by 30° . This corresponds to a phase shift of -30° .
- The voltage drop on an outer conductor is determined by the current I_{L1} .

To set the phase difference for the transformer circuit, proceed as follows:

1. **[MENU]** > **[F4]** Configuration > **[F2]** Transformer data > Press **[→]** until the desired parameter is displayed.
⇒ Transformer circuit.
2. Press **[F1]** or **[F5]** to select the required phase difference.
3. Press **[↵]**.
⇒ The phase difference is set.

8.8 Configurable inputs and outputs

You can individually configure the digital inputs (GPI) and outputs (GPO).

The following digital inputs and outputs are available:

- 6 digital inputs (GPI1...6)
- 2 digital outputs (GPO1 and 2)

8.8.1 Linking inputs with functions

You can activate the inputs as follows :

- Statically using signal statuses
 - The input signal must be continually present (status: high level).
- Dynamically using pulses
 - A pulse (rising edge) is needed at the input. The input signal must change its status from "Low" to "High". If you are using a pulsed input, you can trigger the assigned function at the same time as the keys connected to the inputs also using the control system.

You can recognize pulsed inputs from the preceding "P:". The note "Warning: P = pulsed inputs" is displayed on the screen.

You can assign one of the following functions to each of the digital inputs (GPI 1...6):

Function	Description
Off	No function selected
Remote/Loc.	Define remote/local mode. Signal on: "Remote" operating mode active. Signal off: "Local" operating mode active.
Blocking	Block automatic regulation.
Quick Tap	Activating quick reset (deactivating delay time T1/T2)

MPS tripped	Input for <i>MPS tripped</i> feedback.
MD in progr.	Input for <i>MD in progr.</i> feedback.
DVL 2	Activate desired value level 2
DVL 3	Activate desired value level 3
Blk U raise	Block tap-change operations (raise).
Blk U low.	Block tap-change operations (lower).
P: DV 1	Activate desired value 1
P: DV 2	Activate desired value 2
P: DV 3	Activate desired value 3

Table 17: Functions for digital inputs (GPI 1...6)

If you assign the same functionality to two inputs, the device produces an event message. This also applies if you assign the same functionality via a static input and via a pulsed input.

Other examples of double assignment of functions are (n, m = 1...6):

- GPI n = master/follower and GPI m = P: DV 1
- GPI n = master/follower and GPI m = P: DV 2

To assign a function to a digital input or to deactivate it, proceed as follows:

1. **MENU** > **F4** Configuration > **F3** User I/Os (press **→** for further GPIs).
⇒ GPI
 2. Press **F1** or **F5** until the desired function is displayed.
 3. Press **←**.
- ⇒ The function is set.

Functions can be assigned to all other GPIs as described above. You can select the GPIs as follows:

GPI	Press →
GPI1 – X4:13	-
GPI2 – X4:14	1x
GPI3 – X4:15	2x
GPI4 – X4:16	3x
GPI5 – X4:17	4x
GPI6 – X4:18	5x

Table 18: Configurable GPIs

8.8.2 Linking outputs with functions

You can assign one of the following functions to the digital outputs (GPO 1 and 2):

Function	Description
Off	No function selected
Local/Rem.	Message: <i>Local control/remote control</i>
Undervoltage	Message: <i>Undervoltage blocking</i>
Overvoltage	Message: <i>Overvoltage blocking</i>
Undercurrent	Message: <i>Undercurrent blocking</i>
Overcurrent	Message: <i>Overcurrent blocking</i>
Desired value 1	Message: <i>Desired value 1</i>
Desired value 2	Message: <i>Desired value 2</i>
Desired value 3	Message: <i>Desired value 3</i>
MPS triggered	Message: <i>Motor protective switch was tripped.</i>
Motor runtime >	Message: <i>Motor runtime exceeded.</i>
Motor running	Message: <i>"Motor running"</i>
Bandwidth <	Message: <i>Value fallen below bandwidth</i>
Bandwidth >	Message: <i>Bandwidth exceeded</i>
GPI 1	Message: <i>GPI 1 active</i>
GPI 2	Message: <i>GPI 2 active</i>
GPI 3	Message: <i>GPI 3 active</i>
GPI 4	Message: <i>GPI 4 active</i>
GPI 5	Message: <i>GPI 5 active</i>
GPI 6	Message: <i>GPI 6 active</i>

Table 19: Functions for digital outputs (GPOs 1 and 2)

To assign a function to a digital output or to deactivate it, proceed as follows:

1. Press **MENU** > **F4** Configuration > **F3** User I/Os > Press **→** until the desired parameter is displayed.
⇒ GPO.
2. Press **F1** or **F5** until the desired function is displayed.
3. Press **↵**.
⇒ The function is set.

Functions can be assigned to all other GPOs as described above. You can select the GPOs as follows:

GPO	Press 
GPO1 – X4:9	8x
GPO2 – X4:12	9x

Table 20: Configurable GPOs

8.9 LED selection

You can use this parameter to assign functions to the free LEDs which light up when an event occurs. You can use labeling strips to label the LED.

Depending on your device configuration, the following parameters can be used by MR for special functions. In this case, these parameters are pre-assigned. You may not be able to view or freely assign these parameters.

Functions available for LEDs

An overview of all possible functions which you can assign to the LEDs is provided in the table below.

Functions available	Function description
Off	LED deactivated
GPI x	There is a signal at control input GPI x (e.g. GPI 1)
GPO x	The signaling relay at the GPO x (e.g. GPO 1) output has activated
Undercurrent	Undercurrent present
MPS triggered	Motor protective switch triggered
Blocking	Regulation is blocked
Automatic	Auto mode active
Bandwidth <	Value is below bandwidth
Bandwidth >	Value is below bandwidth
Desired value 1	Desired value 1 activated
Desired value 2	Desired value 2 activated
Desired value 3	Desired value 3 activated
Function monitoring	<i>Function monitoring</i> message active
Remote	Remote mode activated
Local	Local mode activated
Auto	Auto mode activated
Manual	Manual mode activated

Table 21: Functions available for LEDs

Assigning function

To assign a function to an LED, proceed as follows:

1. **MENU** > **F4** Configuration > **F5** LED selection > Press **...** until the desired parameter is displayed.
2. Press **F1** or **F5** to select the option you want.
3. Press **↵**.

⇒ The function is assigned.

All additional LEDs can be assigned as described previously. The LEDs available can be called up as follows:

LED (parameter)	Characteristics	Press ...
LED 1	Single-colored	-
LED 2	Single-colored	1x
LED 3 yellow	Two-colored	2x
LED 3 green	Two-colored	3x
LED 4 rot	Two-colored	4x
LED 4 yellow	Two-colored	5x

Table 22: Configurable LEDs

8.10 Information about device

8.10.1 Displaying info screen

The info screen displays the following information:

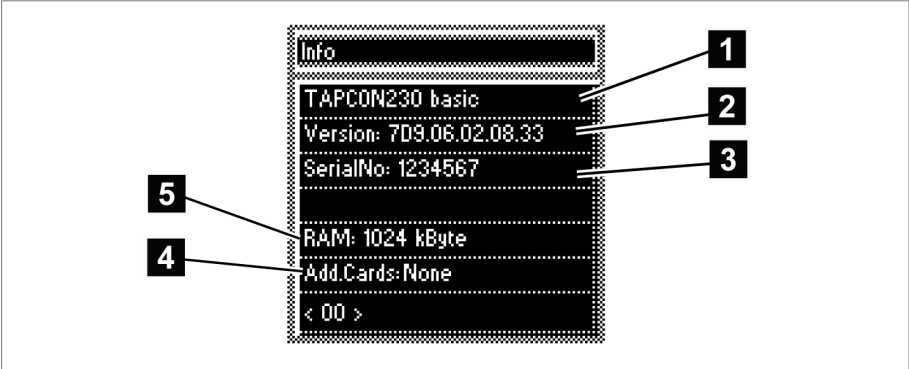

Figure 58: Info screen

1 Type designation	4 Additional cards
2 Software version	5 RAM memory
3 Serial number	

To display the info screen, proceed as follows:

- ▶ **MENU** > **F5** Info.
- ⇒ Info.

8.10.2 Displaying measured values

The current measured values are shown in this display. The values on the right in rows **1**, **2** and **4** are only displayed if the transformer data [▶ Section 8.7, Page 81] has been entered previously. In row **4**, the value actually measured can be seen on the left and the value converted to the transformer circuit is on the right.

The following measured values can be displayed:

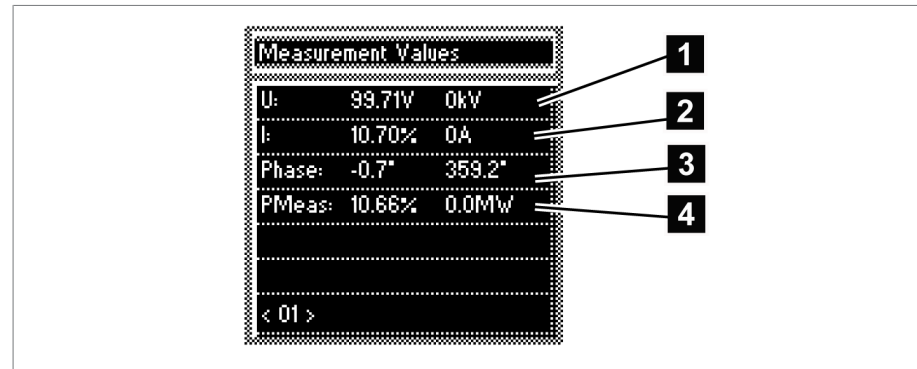

Figure 59: Measured values

1 Voltage U in V or kV	3 Frequency f in Hz
2 Current I in % or A	4 Measurement performance PMeas in % or MW

To display the measured values, proceed as follows:

► **MENU** > **F5** Info > Press **→** until the desired display appears.

⇒ Measured values.

8.10.3 Display calculated values

Calculated values are shown on this screen. The following values can be displayed:

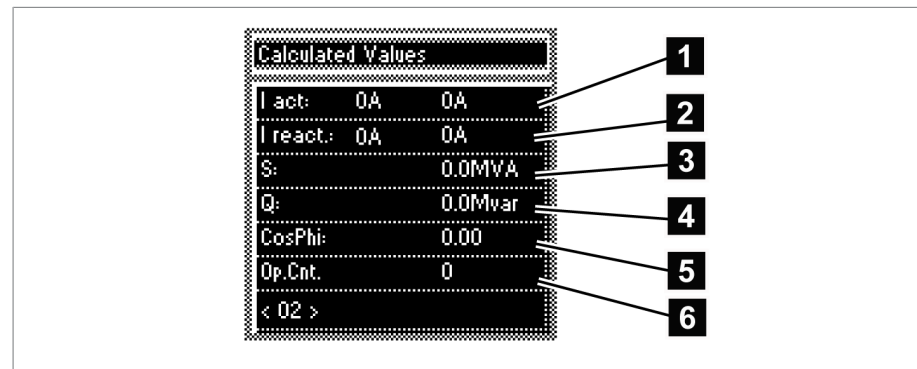

Figure 60: Calculated values

1 I active (active share) in A	4 Reactive power Q in Mvar
2 I reactive (reactive share) in A	5 Power factor cos ϕ
3 Apparent power S in MVA	6 Operation counter

The values in the rows on the right are only displayed if the transformer data has been entered previously.

To display the calculated values, proceed as follows:

- ▶ **MENU** > **F5** Info > Press **→** until the desired display appears.
- ⇒ Calculated values

8.10.4 Carrying out LED test

You can check whether the LEDs are functioning properly. To do this, press the relevant function key to illuminate an LED:

Key	LED no.
F1 ... F5	LED 1...LED 5
F1 + F5 ... F4 + F5	LED 6...LED 9
↵	All LEDs

Table 23: Arrangement of keys for the LED test

This function will only test the functional reliability of the respective LED. The function of the device linked to the LED is not tested.

To carry out the LED test, proceed as follows:

1. **MENU** > **F5** Info > Press **→** until the desired display appears.
⇒ LED test.
2. To carry out the function test, press the function key for the LED you want to test.

8.10.5 Displaying status of the MIO card

The status of the digital inputs and outputs are shown in this display.

Digital inputs

The status of the optocoupler inputs is shown in the "MIO card digital inputs" display. As soon as a continuous signal is present at the input, status **1** is displayed. **0** indicates no signal at the input.

MIO-Card Digital Inputs			
X4-13	0	X4-14	0
X4-15	0	X4-16	0
X4-17	0	X4-18	0
X4-21	0	X4-22	0
X4-23	0	X4-24	0

Proceed as follows to display the status:

► **MENU** > **F5** Info > Press **→** until the desired display appears.

⇒ MIO card digital inputs

Digital outputs

The status of the relays is shown in the "MIO card digital outputs" display. As soon as a relay has activated, status **1** is displayed. If status **0** is displayed, the relay has not activated.

MIO-Card Digital Outputs			
X3-3	0	X3-6	0
X3-9	0	X3-12	1
X4-3	0	X4-6	0
X4-9	0	X4-12	0

Proceed as follows to display the status:

► **MENU** > **F5** Info > Press **→** until the desired display appears.

⇒ MIO card digital outputs

8.10.6 Resetting parameters

With this display you can reset your settings to the factory settings. It also shows whether all parameters are saved correctly.

Resetting the parameters to the factory settings permanently deletes your settings.

To reset all parameters, proceed as follows:

Default Parameter	
Default parameter changed	
Reset to MR default settings	
with pressing F3 & Enter	

1. **MENU** > **F5** Info > Press **→** until the desired display appears.

⇒ Default parameter

2. Press **F3** and **←** at the same time.

⇒ "Default parameter active" is displayed.

⇒ All parameters have been reset to the factory settings.

8.10.7 Displaying memory overview

The memory overview can be used to display various database entries with the relevant number of data records. The information is not relevant for operation. It is only needed for service checks. The following information is displayed:

- Parameter file
- Event data bits
- Flash file
- Events

To display the database entries, proceed as follows:

1. **MENU** > **F5** Info > Press **→** until the desired display appears.
⇒ Memory overview
2. Press **F1** or **F5** to select an entry.
⇒ The relevant number of data records is displayed.

8.10.8 Displaying event overview

This display can be used to display the number of current red and yellow events. The events are marked as follows:

Yellow	Corresponds to an advance warning or status information.
Red	Automatic regulation can block.

Table 24: Coding of events

A list with all events can be found in the Messages section.

To view the event overview, proceed as follows:

- **MENU** > **F5** Info > Press **→** until the desired display appears.
⇒ Event overview.

9 Fault elimination

This chapter describes how to rectify simple operating faults.

9.1 No regulation in AUTO mode

Characteristics/detail	Cause	Remedy
Device control commands have no effect.	LOCAL/REMOTE switch in motor-drive unit switched to LOCAL.	Check operating mode. Correct if necessary.
RAISE/LOWER LEDs light up periodically	No connection	Check wiring as per connection diagram.
Blocking	Reverse power lock active.	Check parameters. Correct if necessary.
	Negative power flow	Check current transformer polarity.
	Function assigned to several GPIs.	Check parameterization of GPIs. Correct if necessary.
	One of the GPIs is parameterized with "Blocking" and has an appropriate input signal.	Check parameterization and status in "Info" menu. Correct if necessary.
	NORMset active	Carry out manual tap-change operation with  or  keys.
	Undercurrent blocking active	Check parameters. Correct if necessary.
Blocking U< LED illuminated	Undervoltage blocking active	Check parameters. Correct if necessary.
Blocking U> LED illuminated	Overvoltage blocking active	Check parameters. Correct if necessary.
Blocking I> LED illuminated	Overcurrent blocking active	Check parameters. Correct if necessary.
Bandwidth set too high	-	Determine the recommended bandwidth

Table 25: No regulation in AUTO mode

9.2 Unexplained tap change

Characteristics/detail	Cause	Remedy
Compensation activated	Setting: <ul style="list-style-type: none"> Line drop compensation Z compensation 	Check parameters. Correct if necessary.

Table 26: Unexplained tap change

9.3 Man-machine interface

Characteristics/detail	Cause	Remedy
Keys <ul style="list-style-type: none"> MANUAL/AUTO operating mode cannot be changed 	REMOTE operating mode active and LED in key illuminated.	Press to activate LOCAL mode.
Keys <ul style="list-style-type: none"> LEDs in keys and not illuminated. 	Parameter error	Reset parameters to factory settings.
Display <ul style="list-style-type: none"> No display. 	Contrast incorrectly set.	Set contrast [► Section 7.1, Page 42].
	Voltage supply interrupted.	Check voltage supply.
	Fuse faulty.	Contact Maschinenfabrik Reinhausen.
LEDs <ul style="list-style-type: none"> Freely configurable LED lights up 	Customized LED parameterization.	Check parameters.
LEDs <ul style="list-style-type: none"> LED flashing 	Input signal not constant.	Check input signal.
COM1 <ul style="list-style-type: none"> Cannot be connected to PC using TAPCON®-trol. 	Different baud rates set.	Check baud rate set on device and PC.

Table 27: Man-machine interface

9.4 Incorrect measured values

Characteristics/detail	Cause	Remedy
Measured voltage <ul style="list-style-type: none"> No measured value. 	Connection has no contact in the plug terminal.	Check wiring and plug terminal.
	Insulation trapped	
	Wire not inserted far enough.	
	Circuit breaker tripped.	Check fuse.
Measured voltage <ul style="list-style-type: none"> Measured value too low. 	Voltage drop on measuring lead.	Check measured voltage at plug terminal X2:1/ X2:2.
Measured voltage <ul style="list-style-type: none"> Measured value fluctuates. 	Possible sources of fault: <ul style="list-style-type: none"> Leads laid in parallel. Tap-change operations. 	Check measured voltage at plug terminal X2:1/ X2:2.
		Increase distance from source of interference.
		Install filter if necessary.
Measured current <ul style="list-style-type: none"> No measured value. 	Line to current transformer interrupted.	Check wiring.
	Short-circuiting jumper in current transformer not removed.	Remove short-circuiting jumper.

Characteristics/detail	Cause	Remedy
Measured current	Transmission ratio not correctly parameterized.	Correct parameterization.
▪ Measured value too high.		
▪ Measured value too low.	Incorrect input connected.	Remove short-circuiting jumper.
Phase angle	Fault in external transformer circuit.	Check transformer circuit.
▪ U/I.	Transformer circuit incorrectly parameterized.	Compare with system connection diagram. Correct parameters. Compare measurement values on info screen. Transpose current transformer connection. Check polarity of transformer circuit. Correct if necessary. Check circuit. Correct if necessary. Check measurement points. Correct if necessary.

Table 28: Incorrect measured values

9.5 Customized GPIs/GPOs

Characteristics/detail	Cause	Remedy
Function expected from the factory setting does not take place	Parameterization has been overwritten manually or via TAPCON®-trol.	Check active parameters
Signal discontinuous.	Intermittent DC voltage.	Check source of DC voltage. Check signal transmitter. Check wiring.
No signal	Supply voltage too low	Reset parameters to factory settings.
Info screens "Bandwidth!", "Delay time T1", "Control response T1", "Delay time T2" display 0.		

Table 29: Fault elimination: GPIs and GPOs

9.6 General faults

Characteristics/detail	Cause	Remedy
No function	No power supply	Check the power supply
▪ <i>Operating status</i> LED does not illuminate	Fuse tripped	Contact Maschinenfabrik Reinhausen GmbH

Characteristics/detail	Cause	Remedy
Relays chatter	Supply voltage too low	Check the supply voltage
	High EMC load	Use shielded cables or external filters
	Poor grounding	Check protective ground

Table 30: General faults

9.7 Other faults

If you cannot resolve a problem, please contact Maschinenfabrik Reinhausen. Please have the following data on hand:

- Serial number
 - Name plate (Outer right side when viewed from the front [► Section 4.5.1, Page 18])
 - Info screen ( >  Info)

Please provide answers to the following questions:

- Has a firmware update been carried out?
- Has there previously been a problem with this device?
- Have you previously contacted Maschinenfabrik Reinhausen about this issue? If yes, then who was the contact?

10 Messages

No.	Event (yellow/red)	Event message	Remark

4	Red	Overvoltage	Message is displayed in the event of overvoltage. Set the Overvoltage U> [► Section , Page 72] parameter.
5	Red	Overcurrent	Message is displayed in the event of overcurrent. Set the Overcurrent I> [► Section , Page 74] parameter.
6	Red	Parallel operation error: Different parallel operation methods	Message is displayed if different parallel operation methods are set for 2 or more devices in the same parallel operation group. Set the Parallel operation method parameter.
7	Yellow	Motor protection device	Triggered by the motor protective switch input.
9	Yellow	Undercurrent	Message is displayed in the event of undercurrent. Set the Undercurrent I< [► Section , Page 75] parameter.
11	Red	Error when setting user inputs (duplicate assignment)	At least 2 user inputs are parameterized to the same function. Message is displayed after the 2nd parameter has been confirmed with  .
12	Yellow	Function monitoring (voltage not adjusted within set time)	Message is displayed if the voltage has not been adjusted within the set time (presetting: 15 minutes).
13	Yellow	Motor-drive unit runtime monitoring	Message is displayed if the set motor runtime is exceeded. Setting motor runtime monitoring [► Section 8.2.8, Page 55] parameters.
14	Red	Analog input value too high. Check your connection to terminal X7!	Message is displayed when the maximum permissible current of 20 mA is exceeded for connection X7.
15	Yellow	Negative analog input value Check your connection to terminal X7!	Message is displayed in the event of reverse polarity or if X7 connection is incorrectly connected.
16	Red	Parameter reloaded! Confirm with F3 & Enter	Message is displayed if the current set of parameters is corrupt or damaged and the system has therefore switched to the standard set of parameters.
17	Yellow	Check sliding contact.	Message is displayed if the resistor contact series is incorrectly connected or has a loose contact.
30	Red	Blocking: Signal at blocking user input	Message is displayed if there is a signal at the set "Automatic regulation blocked" (blocking) user input.
31	Red	Blocking: Negative active power	Message is displayed if the active power is negative and blocking is activated for negative active power.
32	Red	Blocking: User input Lower tap-change blocking	Message is displayed if there is a signal at the set "Raise pulse blocked" (Blk U raise) user input.
33	Red	Blocking: Signal at block raise user input	Message is displayed if there is a signal at the set "Lower pulse blocked" user input.
34	Red	Blocking: Lower blocked because tap position limit reached or exceeded	Message is displayed if lower is blocked because the corresponding tap position limit has been reached or exceeded.

No.	Event (yellow/red)	Event message	Remark
35	Red	Blocking: Raise blocked because tap position limit reached or exceeded	Message is displayed if raise is blocked because the corresponding tap position limit has been reached or exceeded.
36	Yellow	Tap position limit reached or exceeded	Message is displayed if the set tap position limit has been reached or exceeded.
37	Yellow	Negative active power	Message is displayed if the active power is negative.
38	Yellow	No connection to communication interface card	Message is displayed if communication to the communication interface card <i>IEC 61850 card</i> is not possible.

Table 31: Event message

11 Disposal

Observe the national requirements applicable in the country of use.

12 Overview of parameters

This section contains an overview of the relevant menus and parameters. The availability of individual parameters varies depending on your device function.

Parameter	Setting range	Factory setting	Current setting
NORMset			
Normset activation	On/Off	Off	
Desired value 1	49 to 140 V	100 V	
Primary voltage	0...9999 kV	0 kV	
Secondary voltage	57 to 123 V	100 V	
Control parameters > Voltage regulation			
Desired value 1	49 to 140 V	100.0 V	
Desired value 2	49 to 140 V	100.0 V	
Desired value 3	49 to 140 V	100.0 %	
Bandwidth	0.5...9 %	2.00 %	
Delay time T1	0...600 s	40 s	
Control response T1	T1 linear/T1 integral	T1 linear	
Activation T2	T2 on/T2 off	T2 off	
Delay time T2	1...10 s	10.0 s	
Control parameters > Limit values			
Undervoltage U< [%]	60...100 %	90 %	
Delay time U<	0...20 s	10.0 s	
U< undervoltage blocking	On/Off	On	
U< below 30 V	On/Off	Off	
Overvoltage U> [%]	100...140 %	110 %	
U> overvoltage blocking	On/Off	Off	
Overcurrent I> [%]	50...210 %	110 %	
I> overcurrent blocking	On/Off	On	
Undercurrent I< [%]	0...210 %	0 %	
I< undercurrent blocking	On/Off	Off	
Negative active power blocking	On/Off	Off	
Control parameters > Compensation			
Compensation method	LDC/Z	LDC	
line drop compensation Ur	-25 to 25 V	0.0 V	
line drop compensation Ux	-25 to 25 V	0.0 V	
Z compensation	0...15 %	0.0 %	
Z comp. limit value	0...15 %	0.0 %	

Parameter	Setting range	Factory setting	Current setting
Configuration > Transformer data			
Primary voltage	0...9999 kV	0 kV	
Secondary voltage	57 to 123 V	100.0 V	
Primary current	0...10000 A	0 a	
Current transformer connection	Unknown; 1 A; 5 A	Unknown	
Transformer circuit	See [► Section 8.7.5, Page 84]	0 1PH	
Display kV / V	kV/V	V	
Display %/A	%/A	%	
Configuration > General			
Language	See [► Section 7.2.1, Page 43]	German	
Regulator ID	-	0000	
Baud rate	9.6 kilobaud; 19.2 kilobaud; 38.4 kilobaud; 57.6 kilobaud	57.6 kilobaud	
R/L pulse duration	0...10 s	1.5 s	
Operation counter	0...99999999	0	
Display dimming	On/Off	On	
Key lock	On/Off	On	
Function monitoring	On/Off	Off	
Delay function monitoring	0...120 min	15 min	
Motor runtime	0...30 s	0.0 s	
Manual/Automatic	Manual/Auto	Manual	
Local/Remote	Local/Remote	Local	
COM1 password	-	-	
Password duration	1...50 min	5 min	
Configuration > User In/Outputs			
GPI 1 – X4:13	See [► Section 8.8, Page 88]	Off	
GPI 2 – X4:14		Off	
GPI 3 – X4:15		Off	
GPI 4 – X4:16		Quick Tap	
GPI 5 – X4:17		Desired value 2	
GPI 6 – X4:18		Desired value 3	
GPO 1 – X4:9		Off	
GPO 2 – X4:12		Off	
Configuration > LED selection			

Parameter	Setting range	Factory setting	Current setting
LED1	See [► Section 8.9, Page 91]	GPI 1	
LED2		GPI 2	
LED3 yellow		Off	
LED3 green		Off	
LED4 yellow		Off	
LED4 red		Off

Table 32: Overview of parameters

13 Technical data

13.1 Display elements

Display	LCD, monochrome, graphics-capable 128 x 128 pixels
LEDs	15 LEDs for operation display and messages of which 4 LEDs are freely programmable (2x yellow, 1x yellow/green, 1x yellow/red)

Table 33: Display elements

13.2 Electrical data

Permissible voltage range	90...264 V AC 100...353 V DC U_N 100...240 V AC U_N 100...353 V DC
Permissible frequency range	50 / 60 Hz
Power consumption	12.5 VA

Table 34: Electrical data

13.3 Dimensions and weight

Housing (W x H x D)	198 x 310 x 95.5 mm
Door (W x H)	242 x 343 mm
Weight	6.0 kg

Table 35: Dimensions and weight

Figure 61: Front view and side view

Figure 62: View from above with installed door

Figure 63: View from below without door

13.4 Ambient conditions

Operating temperature	-25°C...+70°C
Storage temperature	-40°C...+85°C

Table 36: Ambient conditions

13.5 Electrical safety

IEC 61010-1 IEC 61010-2-030 IEC 61010-2-201	Safety requirements for electrical measurement and control and regulation equipment and laboratory instruments <ul style="list-style-type: none">▪ Protection class 1▪ Overvoltage category III▪ Contamination level 2▪ Measurement category III
IEC 61131-2	Dielectric test with operating frequency 350 V AC...5870 V AC (depending on the operating voltage of the power circuit)
IEC 60255	Dielectric test with impulse voltage 5 kV, 1.2/50 µs
VDE 0435	Short-time current and long-term load capacity of current transformer inputs <ul style="list-style-type: none">▪ $100 \times I_n / 1 \text{ s}$▪ $2 \times I_n / \text{continuous}$

Table 37: Electrical safety

13.6 Electromagnetic compatibility

IEC 61000-4-2	Electrostatic discharges (ESD) 8 kV/15 kV
IEC 61000-4-3	Electromagnetic fields (HF) 20 V/m 80...3000 MHz
IEC 61000-4-4	Fast transients (burst) 6.5 kV
IEC 61000-4-5	Surge transient immunity 2 kV (outer conductor/outer conductor), 4 kV (outer conductor/ground)
IEC 61000-4-6	HF interference immunity (lines) 10 V, 150 kHz...80 MHz
IEC 61000-4-8	Power frequency magnetic field immunity 1000 A/m
IEC 61000-6-2	Immunity requirements for industrial environments
IEC 61000-6-4	Emission standard for industrial environments

Table 38: Electromagnetic compatibility

13.7 Environmental durability tests

DIN EN 60529	Determination of protection class for "protection against contact, ingress of foreign objects and water for electrical equipment" Level IP54
IEC 60068-2-1	Dry cold - 25 °C / 16 hours
IEC 60068-2-2	Dry heat + 70 °C / 16 hours
IEC 60068-2-3	Constant moist heat + 40 °C / 93% / 21 days
IEC 60068-2-30	Cyclic moist heat (12 + 12 hours) + 55 °C / 93% and + 25 °C / 95% / 6 cycles

Table 39: Environmental durability tests

13.8 Mechanical stability

IEC 60068-2-31	Drop and topple, unpacked 100 mm fall height
IEC 60068-2-32	Free fall, unpacked 250 mm fall height
IEC 255-21-1 Class 1	Bounce test
IEC 255-21-2 Class 1	Shock and bump test
IEC 255-21-3 Class 1	Seismic test
